MiningSuite

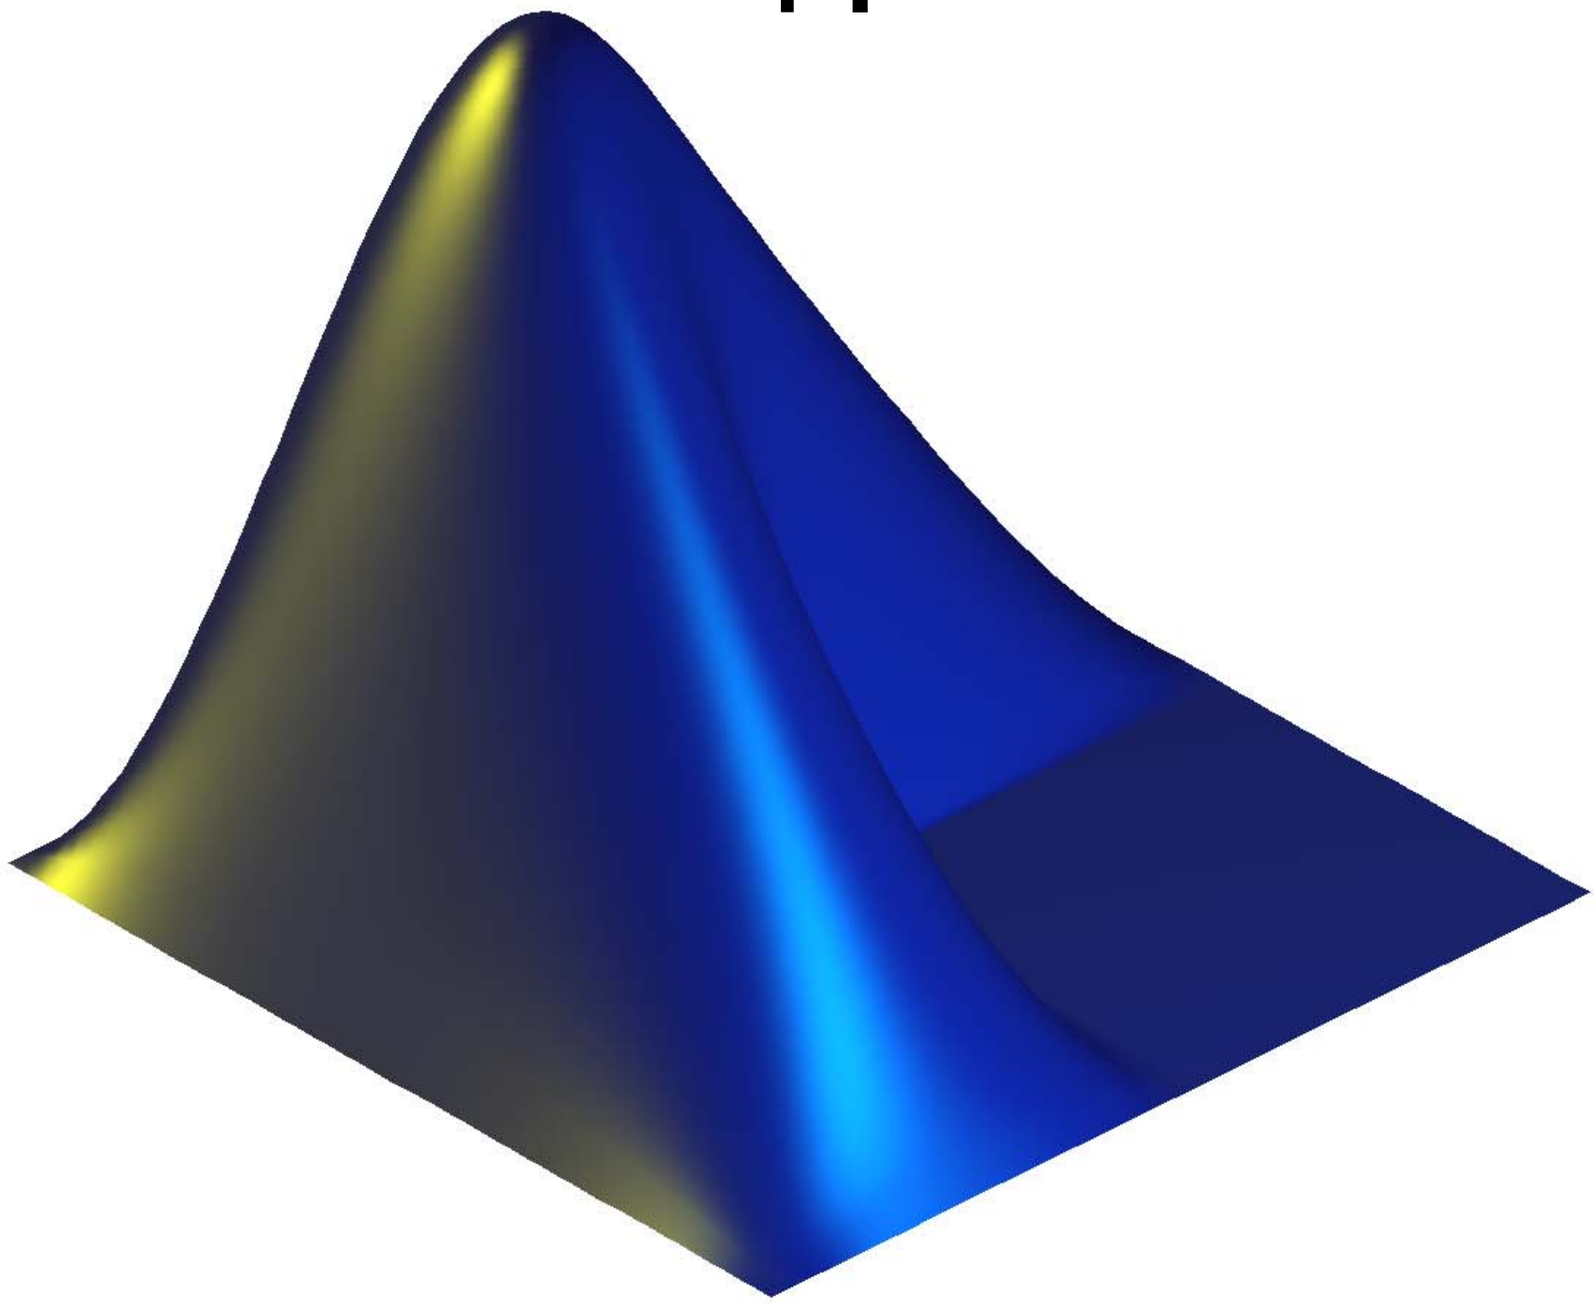
A comprehensive framework for music analysis, articulating audio (MIRtoolbox 2.0) and symbolic approaches

Olivier Lartillot
Aalborg University, Denmark

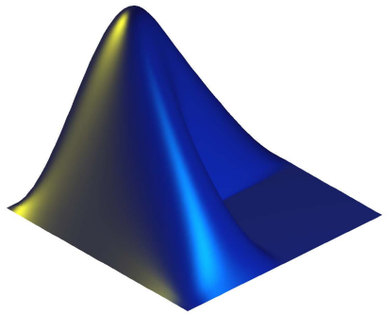
Tutorial overview

1. General description: Aims, architecture, syntax, …
2. Audio-based approaches (*MIRtoolbox* 2.0)
3. Symbolic approaches: "*MIDItoolbox* 2.0" and new musicological models
4. How it works
5. How you can contribute: open-source community

1.



General description



MiningSuite

- Matlab framework
- Large range of audio and music analysis tools
- Both audio and symbolic representations
- Highly adaptive syntactic layer on top of Matlab
- Syntactic layer within the operators' Matlab code, simplifying and clarifying the code
- Memory management mechanisms

MIRtoolbox

- Matlab framework ✔ (but intricate, non-optimized)
- Large range of audio and music analysis tools ✔
- Both audio and symbolic representations ✘
- Highly adaptive syntactic layer on top of Matlab ✔
- Syntactic layer within the operators' Matlab code, simplifying and clarifying the code ✘
- Memory management mechanisms ✔

What's new in MiningSuite

- Code & architecture entirely rebuilt
    - More efficient, more readable, better organised, better generalisable
- Integration audio / symbolic representations
- Innovative and integrative set of symbolic-based musicological tools and pattern mining
- Syntactic layer within the operators' Matlab code, simplifying and clarifying the code
- Open-source collaborative environment

Aim of this tutorial

- Overview of audio and symbolic approaches
  - Quick tour of computational audio/music analysis
  - Take benefit of the capabilities of the environment
    - User-friendly syntax
- Understand how the framework works
- Add new features and new codes in the project

MIRtoolbox history

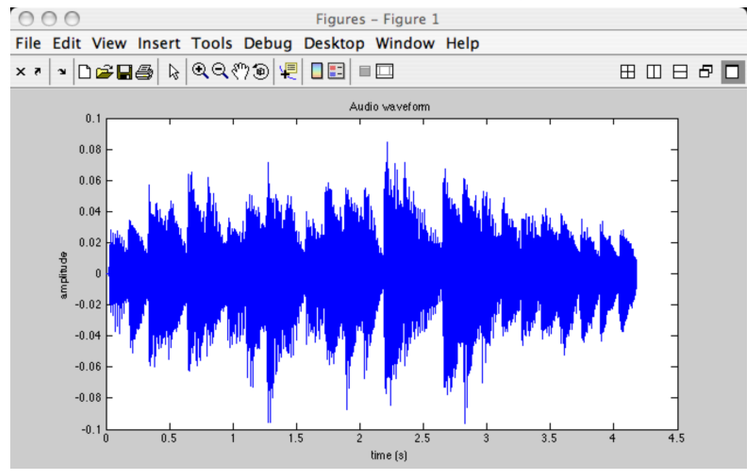
- Matlab toolboxes @ University of Jyväskylä:
  - *MIDItoolbox* (Eerola & Toiviainen, 2004)
  - *Music Therapy Toolbox* (Lartillot, Toiviainen, Erkkilä, 2005)
- European project *Tuning the Brain for Music* (NEST, FP6, 2006–08)
  - **Large range of audio/musical features** extracted from large databases, linked to emotional ratings (ISMIR 2009)
- Master program @ University of Jyväskylä, MIR course (2005–)
  - Toolbox **easy to use**, no Matlab expertise required
- version 1.0 in 2007, current version 1.5.

MIRtoolbox advantages

- Highly modular framework:
  - building blocks can be reused, reordered
  - no need to recode processes, to reinvent the wheel
- Adaptive syntax: users can focus on design, *MIRtoolbox* takes care of technical details
- Free software, open source: Capitalized expertise of the research community, for everybody
- 10000s download, 500+ citations, reference tool in MIR

MIRtoolbox syntax

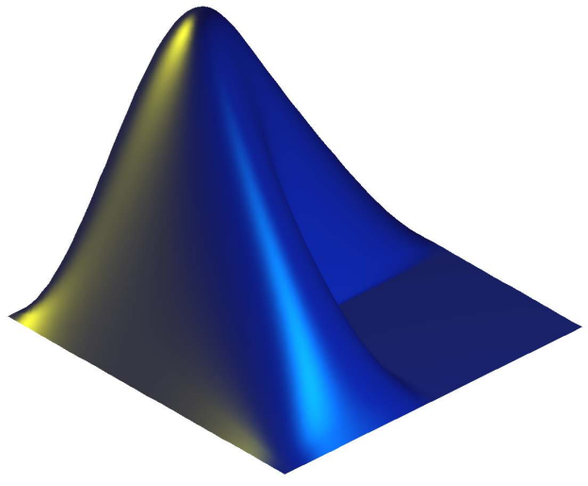
- ***mir****audio('ragtime.wav')* outputs a figure:



- *miraudio('ragtime.wav')****;*** blocks figure display
- ***mir****tempo('ragtime.wav')*
- *mirtempo('**Folder**')* operates on all files in the Current Directory
- ***a =*** *miraudio('ragtime.wav'****, 'Extract', 0, 60, 's'****)*
- ***a*** *= miraudio(****a****, 'Center');*
- *t = mirtempo(a)*
- *d =* ***mirgetdata****(t)* returns the result in *Matlab* array
- ***get****(t, '****Sampling****')* returns additional data stored in *MIRtoolbox* object

MiningSuite history

- Academy of Finland research fellowship, 2009-14
  - Integrating audio and symbolic into common framework, higher-level music analysis
- *MIRtoolbox*: a “Rube Goldberg machine”
  - Obscure architecture, obscure code, highly inefficient in speed and memory → rewrite
- *MIRtoolbox* innovative framework draws interest outside MIR
  - Reorganize framework into discipline-focused packages
- *MIDItoolbox* did not evolve since 1.0 (2004)



MiningSuite

- SIGMINR: signal processing
- AUDMINR: auditory modelling
- MUSMINR: music analysis
- PATMINR: pattern mining
- SEQMINR: sequence processing
- VOCMINR: voice analysis?

Packages

- In *MIRtoolbox*, all operators start with *mir…* prefix (***mir****audio*, ***mir****spectrum*, etc.)
    - to avoid conflicts with other Matlab functions

- In *MiningSuite*, each module (*SigMinr*, *AudMinr*, etc.) is a *package*: its operators are called using a particular prefix (***sig.****spectrum*, ***aud.****spectrum*, etc.)

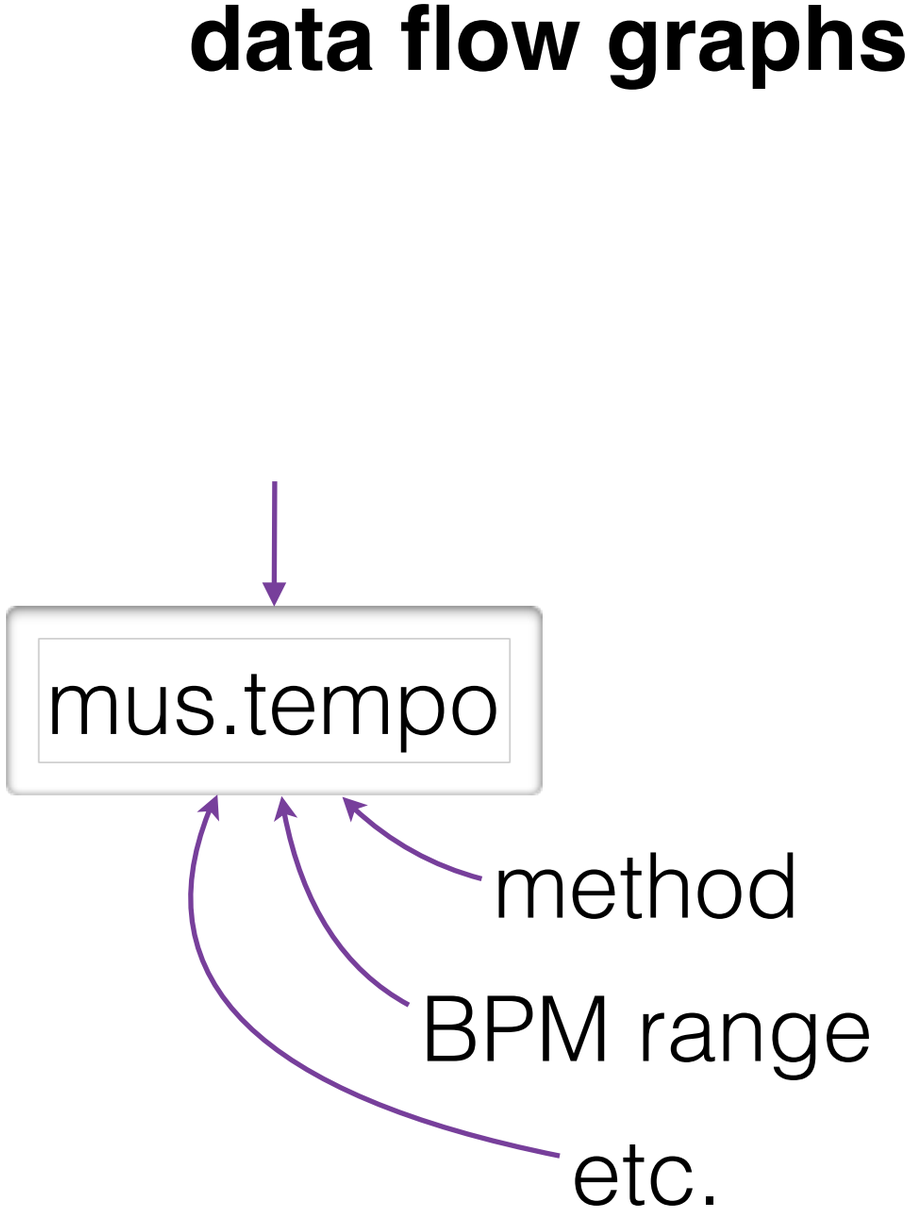
Signal domain

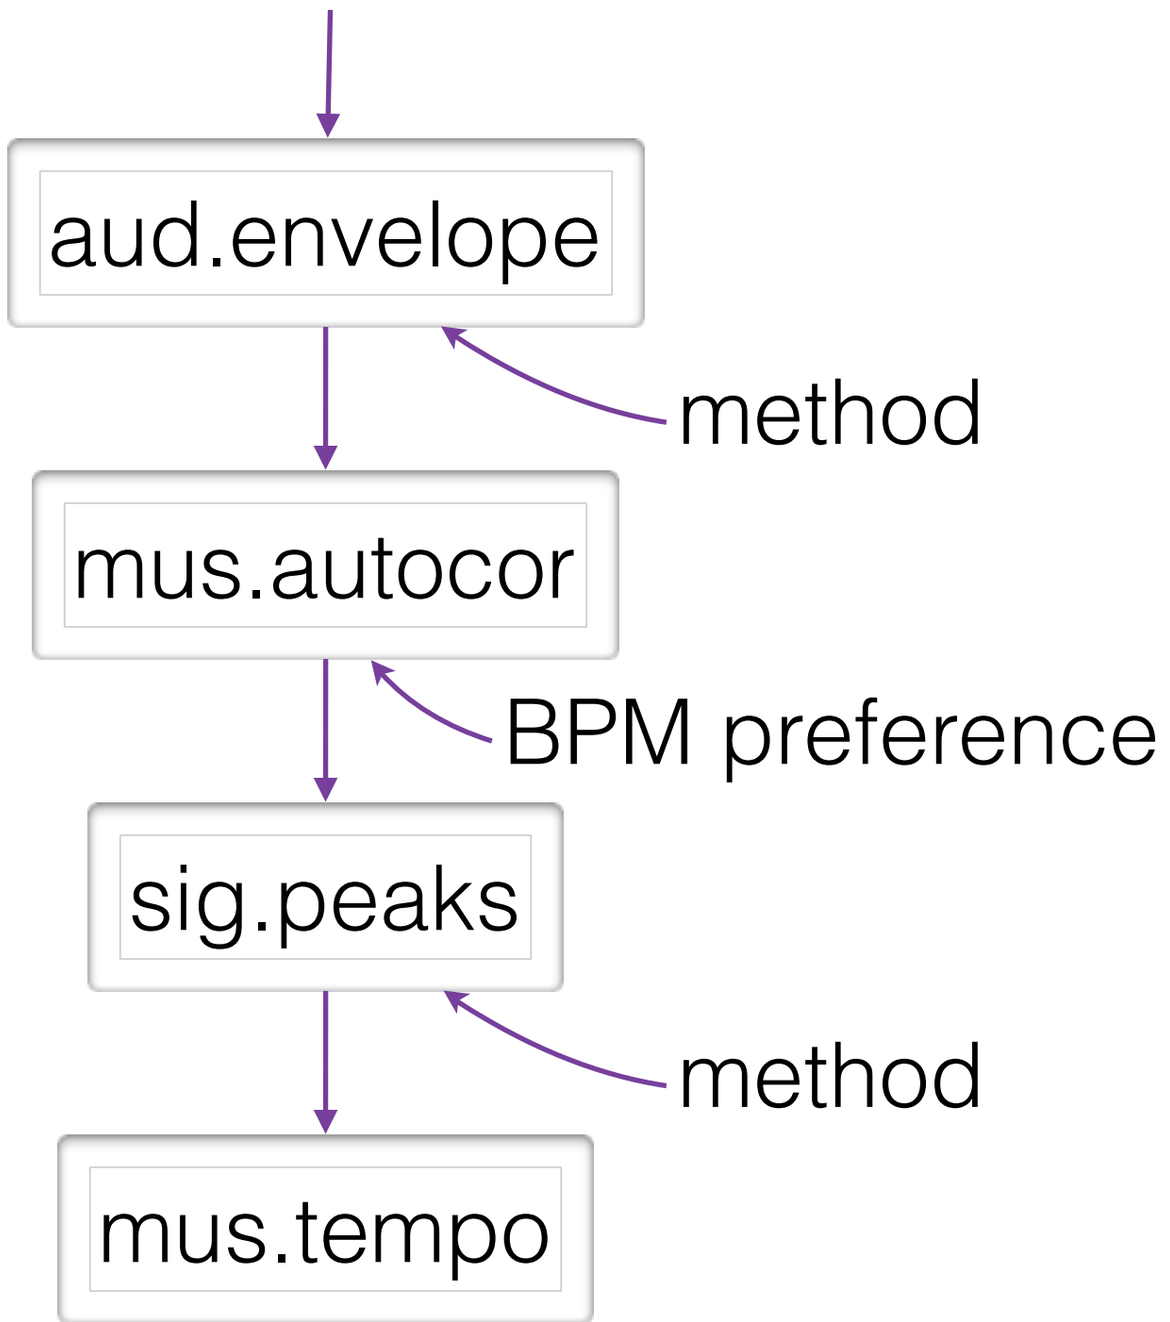
- SIGMINR
  - sig.input, sig.spectrum, …
- AUDMINR
  - aud.spectrum, …
  - aud.mfcc, aud.brightness, …
- MUSMINR
  - mus.spectrum, …
  - mus.tempo, mus.key, …

- Sets of operators related to signal processing operations, audio and musical features
- Versions specific to particular domains
- Each operator can be tuned with a set of options

Signal domain: Modular

data flow graphs





Symbolic domain

- MUSMINR

- ~~*Succession* of operations applied to input signal?~~

- Several types of analysis applied *together for each successive note* of the symbolic sequence

- One single operator: ***mus.score***

- Types of analysis selected as options of *mus.score*

Symbolic domain

- AUDMINR: *aud.score* (auditory scene transcription)
- MUSMINR: *mus.score*
- SEQMINR: sequence management
- PATMINR: sequential pattern mining

Software dependencies

- *MathWorks*' *Matlab* 7.6 (r2008a) or newer versions.
    - But *Matlab* 8.2 (r2013b) or newer is strongly recommended, because *MiningSuite* easily crashes on previous versions*.

- *MathWorks*' *Signal Processing Toolbox*

- Included in the distribution: *Auditory Toolbox* (Slaney), *Music Analysis Toolbox* (Pampalk)

* versions 7.6 to 8.2: there exists a workaround based on debug mode.

MiningSuite development

- Started in 2010
- Sneak Peek version 0.6 released in January 2014 for AES Semantic Audio. Proof of concept, basic architecture
- Beta version 0.8 released now for ISMIR 2014. **Focus on the architecture**, not on the exact feature implementation. Analytical results cannot be trusted!
- Version 0.9 will contain most of the *MIRtoolbox* implementation, user's guide (in wiki) and code documentation.
- Version 1.0 with complete bench test. We need you..
- Further versions: We definitely need you!

sig.input

- In *MIRtoolbox*: *miraudio*. But *SigMinr* is not restricted to audio only, but any kind of signal.

- *sig.signal* is the actual signal object (cf. part IV)

- *sig.input* takes care of the transformations of the signal representation before further processing

- *sig.input(v, sr)* converts a *Matlab* vector *v* into a signal of sampling rate *sr*

sig.input

- *sig.input('myfile')**
- Formats: .wav, .flac, .ogg, .au, .mp3, .mp4, .m4a
- Using *Matlab*'s *audioread*

* Indicate the file extension as well (because *audioread* requires that).

(*sig.input* actually calls routine from *AudMinr* for the processing of audio files.)

sig.input: transformations

- By default, multi-tracks are summed into mono.
  - *sig.input('mysong', '**Mix**', 'no')* keeps the multitrack decomposition.
- *sig.input(..., '**Center**')* centers the signal.
- *sig.input(..., '**Sampling**', r)* resamples at rate *r* (in Hz.), using *resample* from *Signal Processing Toolbox*
- *sig.input(..., '**Normal**')* normalizes with respect to RMS

sig.input: extraction

- *sig.input(…, '**Extract**', 1, 2, '**s**', '**Start**')*
  - extracts signal from 1 s to 2 s after the start

- *sig.input(..., 'Extract', 44100, 88200, '**sp**')*
  - from samples #44100 to 88200 after the start

- *sig.input(..., 'Extract', -1, +1, '**Middle**')*
  - from 1 s before to 1 s after the middle of the signal

- *sig.input(..., 'Extract', -10000, 0, 'sp', '**End**')*
  - the last 10000 samples in the signal

sig.input: trimming silence

- *sig.input(…, '**Trim**')* trims (pseudo-)silence at start and end

- *miraudio(..., '**TrimStart**')* at start only

- *miraudio(..., '**TrimEnd**')* at end only

- *miraudio(..., '**TrimThreshold**', thr)* specifies the silence threshold. Default *thr = .06*

- Silent frames have RMS energy below *thr* times the medium RMS energy of the whole audio file.

aud.play: sonification

aud.save: save in audio file

Ouput file names can be specified in different ways:

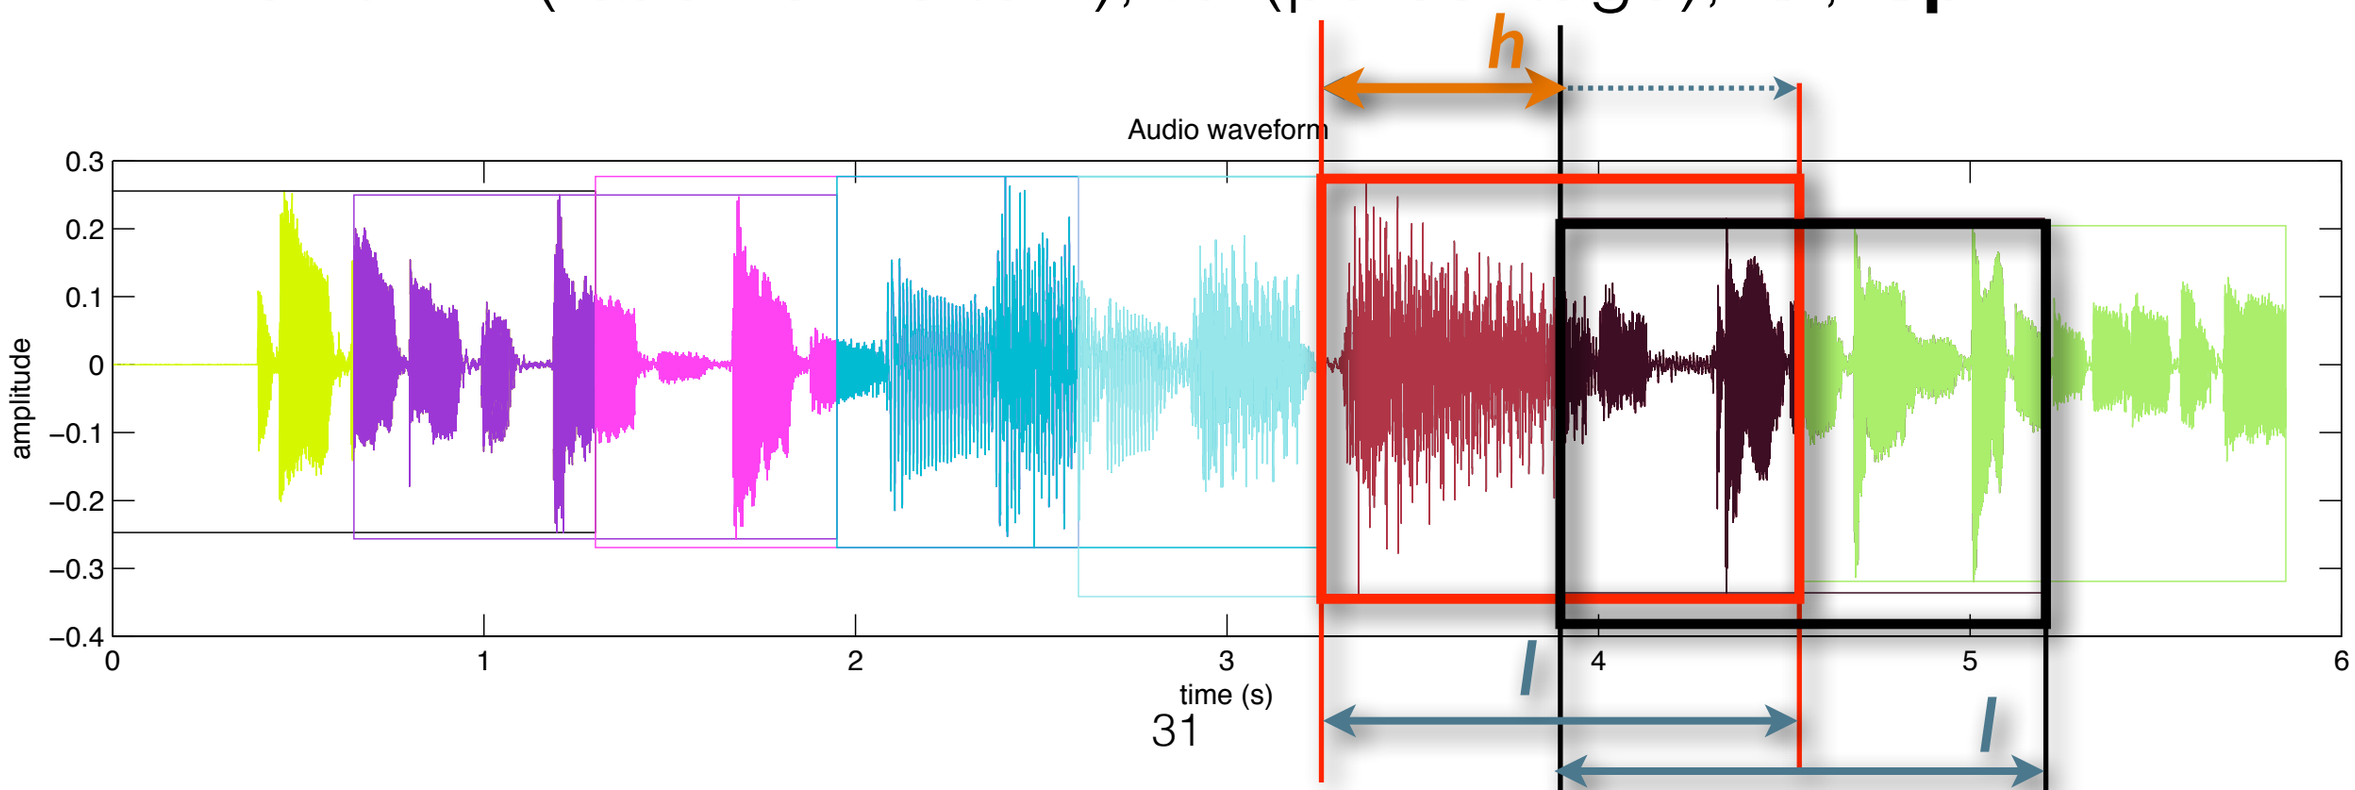
a = miraudio('mysong.au')	mysong.au
mirsave(a)	mysong**.mir**.au
mirsave(a,'new')	**new**.au
mirsave(a,'.wav')	mysong**.mir.wav**
mirsave(a,'new.wav')	**new.wav**

a = miraudio('Folder')	song1.wav	song2.wav	song3.au
mirsave(a)	song1**.mir**.wav	song2**.mir**.wav	song3**.mir**.au
mirsave(a,'new')	song1**new**.wav	song2**new**.wav	song3**new**.au
mirsave(a,'.wav')	song1**.mir.wav**	song2**.mir.wav**	song3**.mir.wav**
mirsave(a,'new.wav')	song1**new.wav**	song2**new.wav**	song3**new.wav**

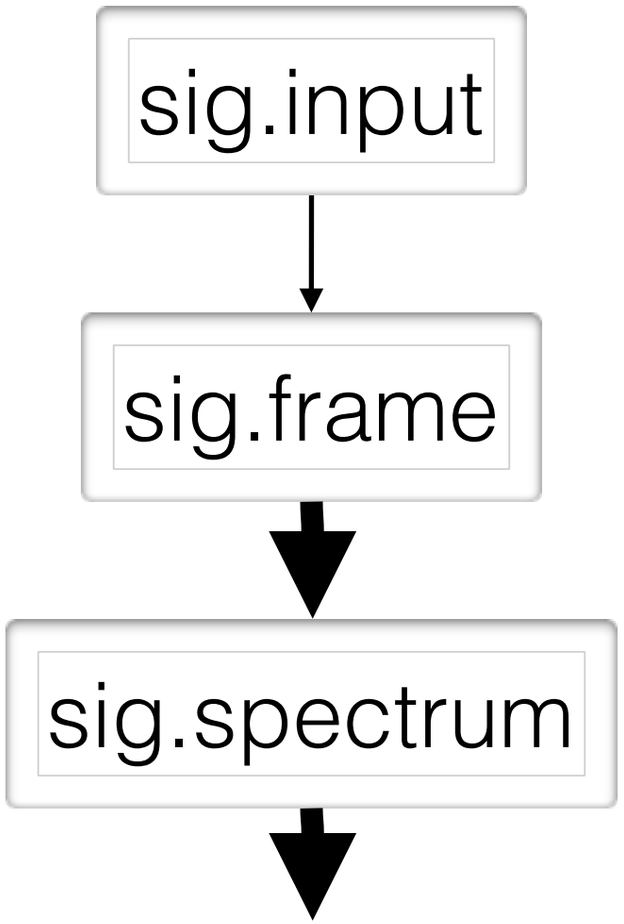
sig.frame
frame decomposition

- *f = sig.frame(…, '**FrameSize**', l, 's')*
  - unit: '**s**' (seconds), '**sp**' (samples)
- *f = sig.frame(..., '**FrameHop**', h, '/1')*
  - unit: '**/1**' (ratio from 0 to 1),'**%**' (percentage), '**s**', '**sp**'

aud.play(f)
aud.save(f)



sig.frame
frame decomposition



- *a = sig.input(…*
- *f = sig.frame(a)*
- *s = sig.spectrum(f)*

Or: *s = sig.spectrum(…, ‘Frame’)*

‘*Frame*’ option frame decomposition

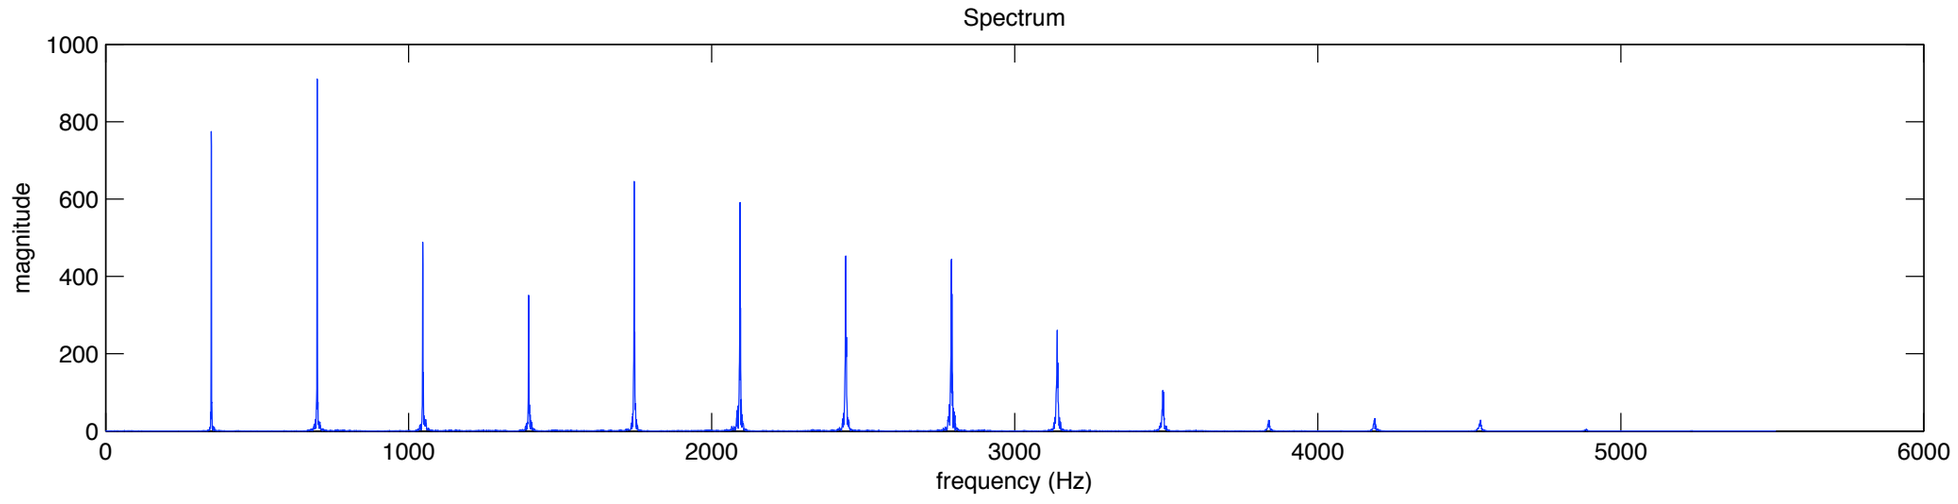
- *sig.input(…, ‘FrameSize’, …, ‘FrameHop’, …)*
- *sig.spectrum(…, ‘FrameSize’, …, ‘FrameHop’, …)*
- *sig.spectrum(…, ‘Frame’)* (default frame configuration)
- ‘*Frame*’ option available to most operators, each with its own default frame configuration
- Each operator can perform the frame decomposition where it is most suitable.

sig.spectrum
frequency spectrum

Discrete Fourier Transform of audio signal x:

$$X_k = \sum_{n=0}^{N-1} x_n e^{-\frac{2\pi i}{N} kn} \qquad k = 0, \ldots, N-1$$

Amplitude spectrum: *s = sig.spectrum(…)*



Phase spectrum: *s.phase*

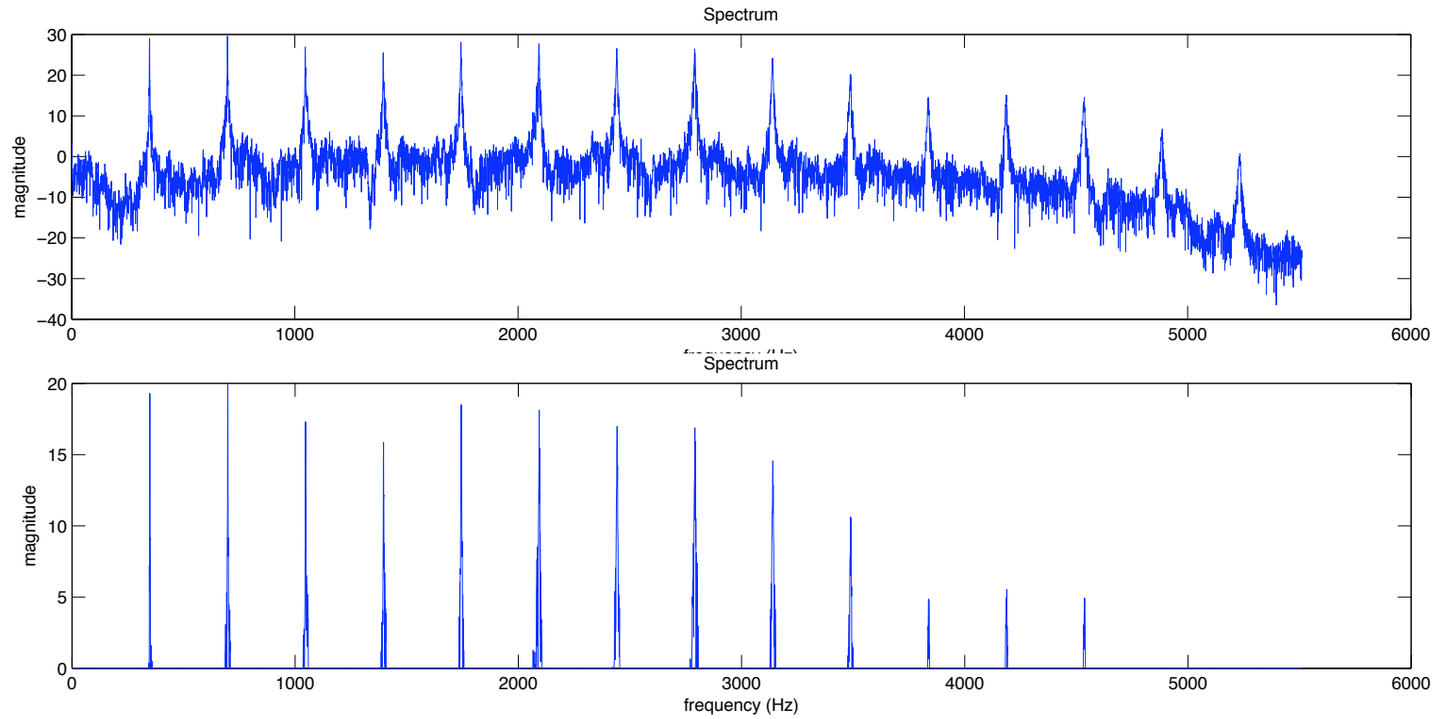
Fast Fourier Transform using *Matlab's fft* function.

sig.spectrum parameter specification

- *sig.spectrum(…, 'Min',* 0*)* in Hz
- *sig.spectrum(…, 'Max',* sampling rate/2*)* in Hz
- *sig.spectrum(…, 'Window', 'hamming')*
- frequency resolution r, in Hz:
  - *sig.spectrum(…, 'Res',* r*)*: exact resolution specification
  - *sig.spectrum(…, 'MinRes',* r*)*: minimal resolution (less precise constraint, but more efficient)
- *sig.spectrum(…, 'Phase', 'No')*

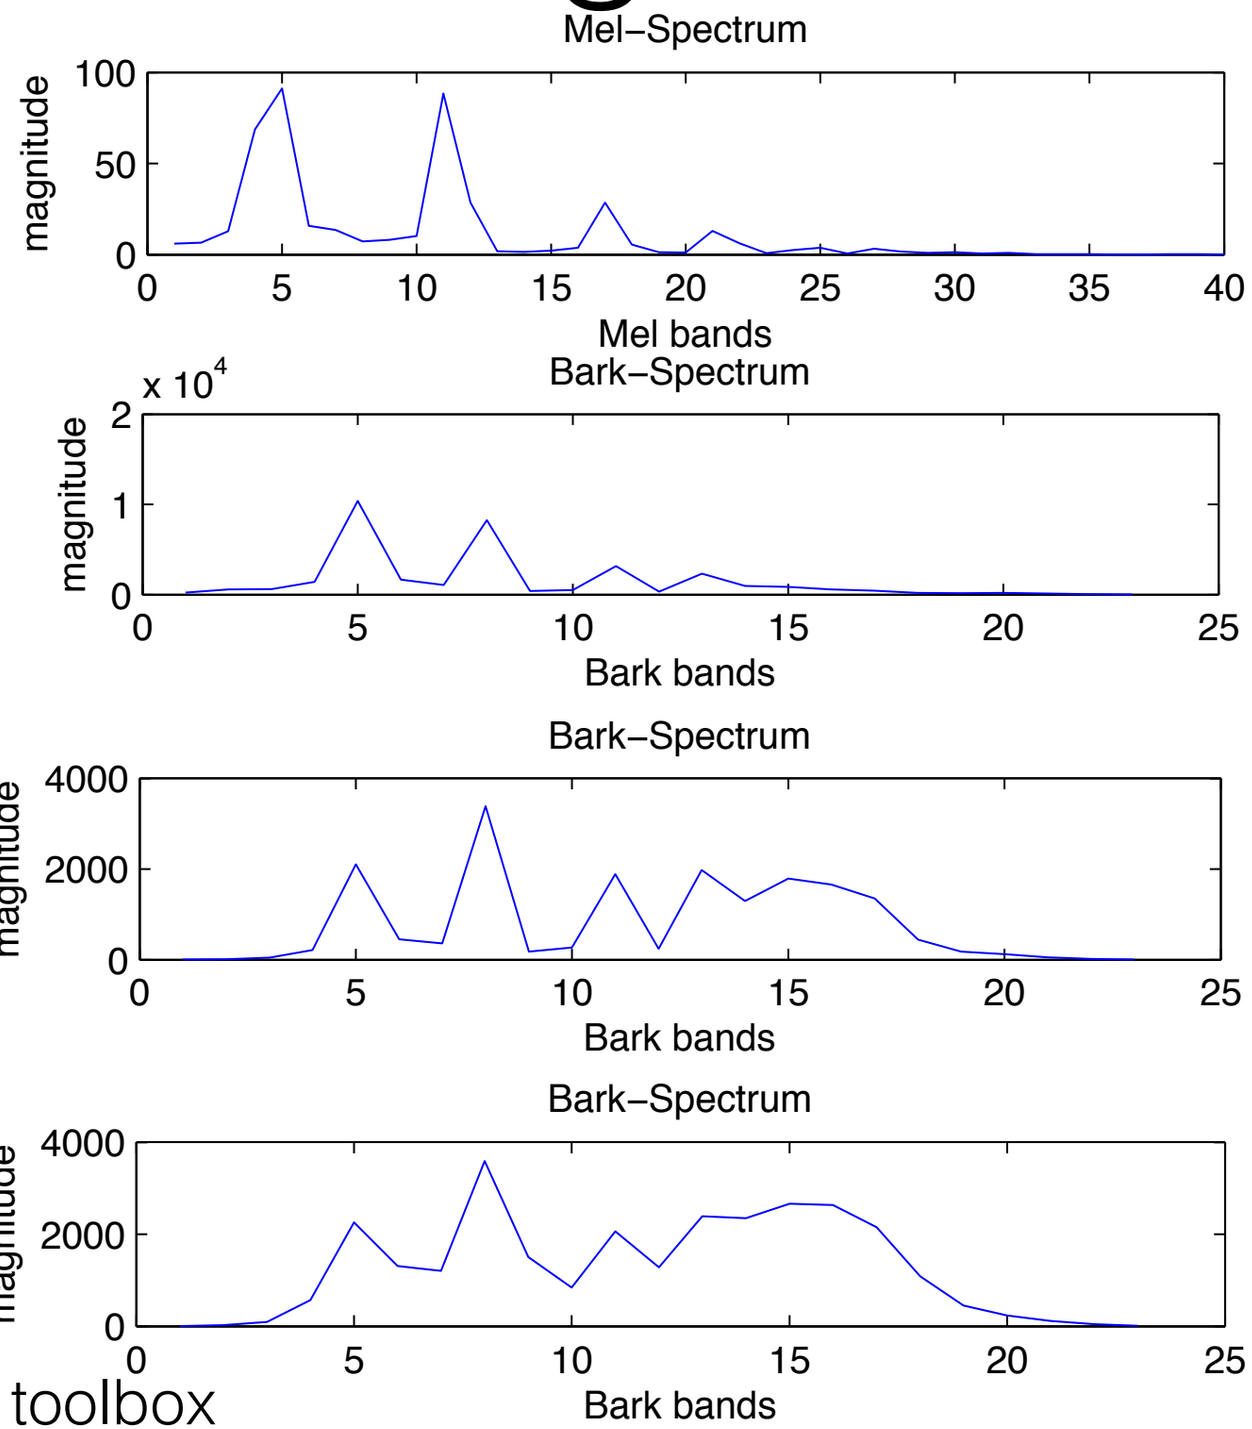
sig.spectrum post-processing

- *mirspectrum(..., 'Normal')* normalizes w.r.t. energy.
- *mirspectrum (..., 'Power')* squares the energy.
- *mirspectrum(..., 'dB')*
  - in dB scale
- *mirspectrum(..., 'dB', th)*
  - th highest dB
- *mirspectrum(..., 'Smooth', o)*
- *mirspectrum(..., 'Gauss', o)*



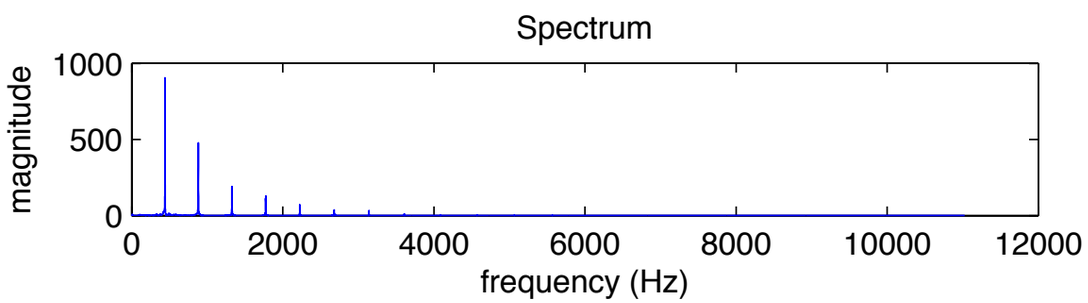
aud*.spectrum*
auditory modeling

- *aud.spectrum(…, '**Mel**')*
  - Mel-band decomposition
- *aud.spectrum(..., '**Bark**')*
  - Bark-band decomposition
- *aud.spectrum(..., '**Terhardt**'):*
  - Outer-ear modeling
- *aud.spectrum(..., '**Mask**'):*
  - Masking effects along bands

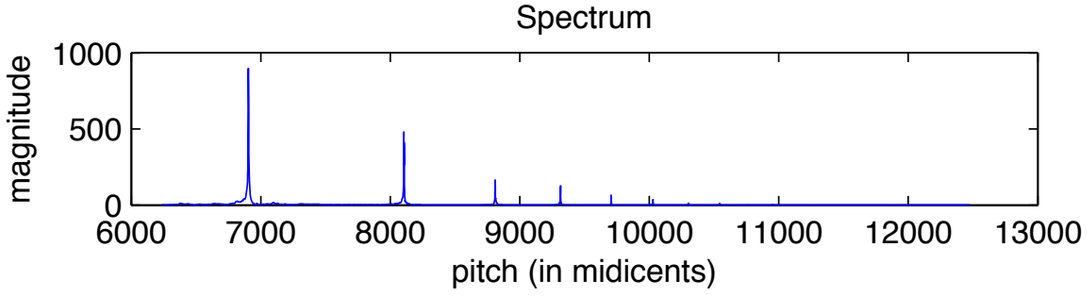


based on *Auditory toolbox* and *Music Analysis* toolbox

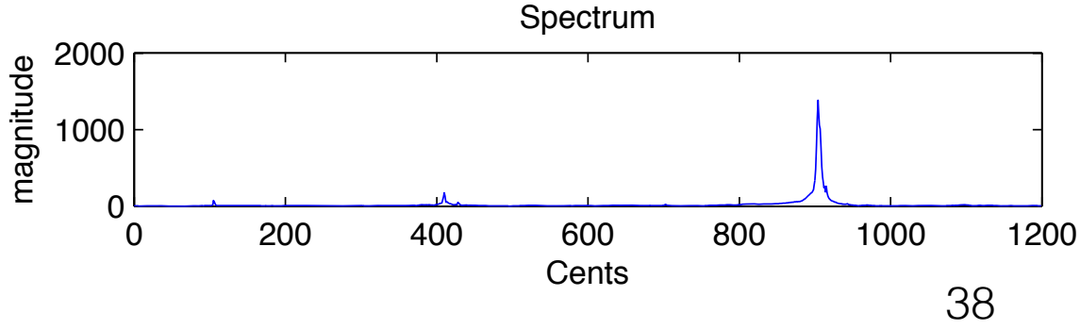
mus.*spectrum*
pitch-based distribution



- *mus.spectrum(…, '**Cents**')*

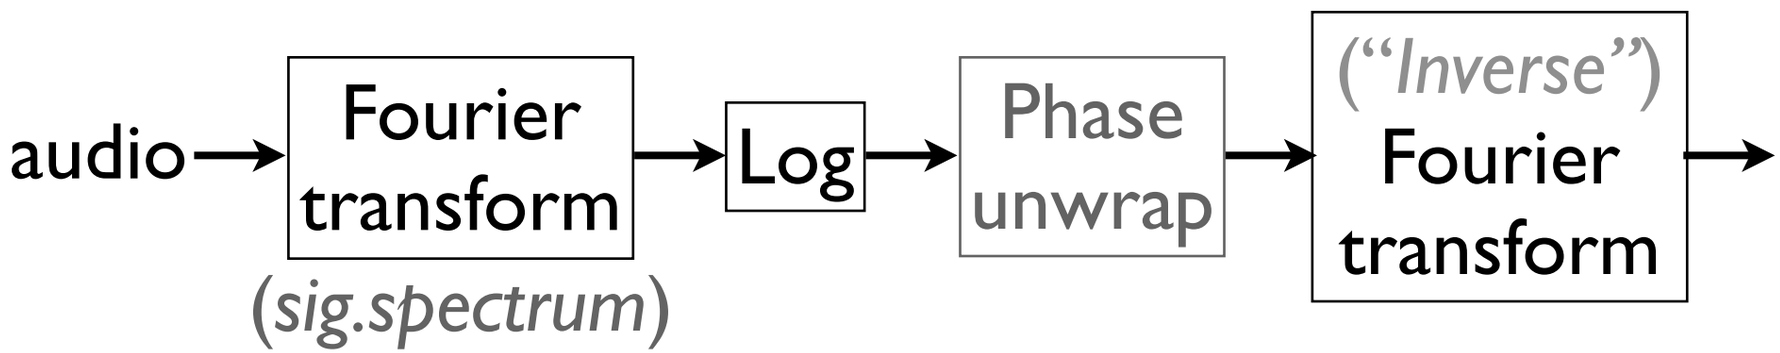


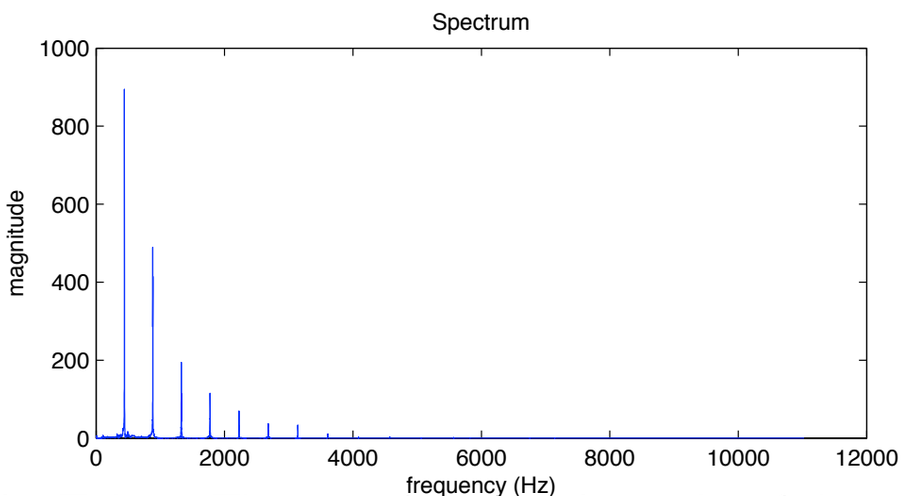
- *aud.spectrum(..., '**Collapsed**'):* into one octave, divided into 1200 cents

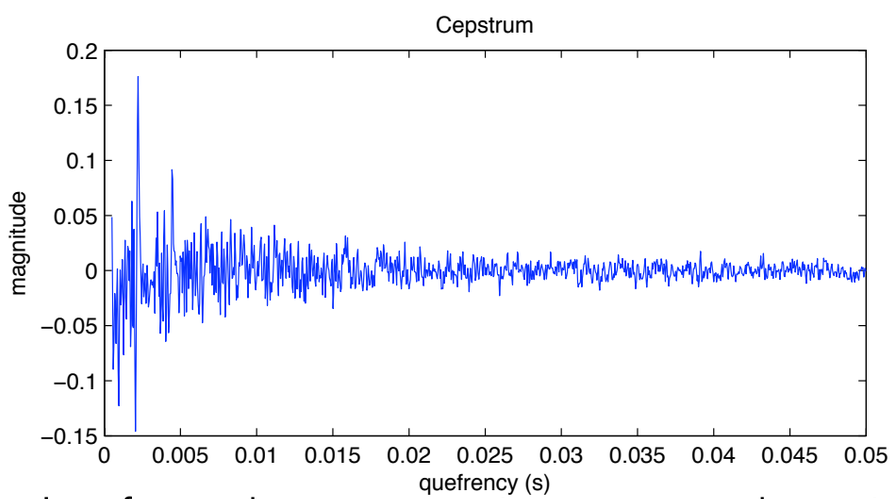


sig.cepstrum
cepstral analysis

*sig.cepstrum(…, '**Complex**')*: complex cepstrum



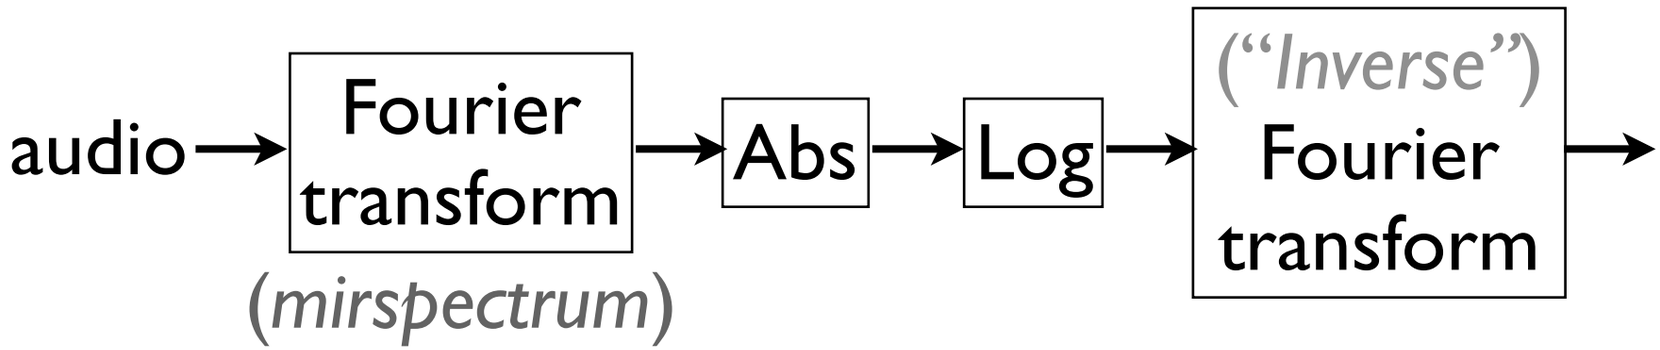


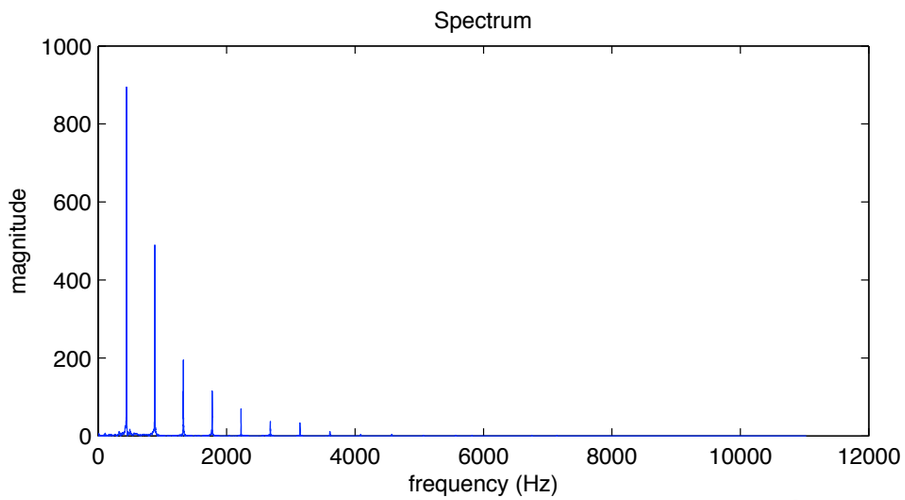


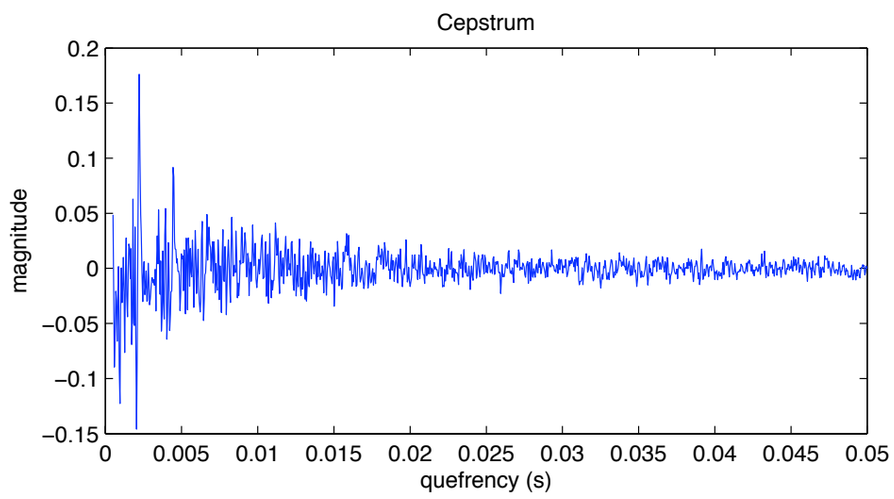
Bogert, Healy, Tukey. The quefrency alanysis of time series for echoes: cepstrum, pseudo-autocovariance, cross-cepstrum, and saphe cracking. Symposium on Time Series Analysis, Chapter 15, 209-243, Wiley, 1963.

sig.cepstrum
cepstral analysis

*sig.cepstrum(…, '**Real**')*: real cepstrum





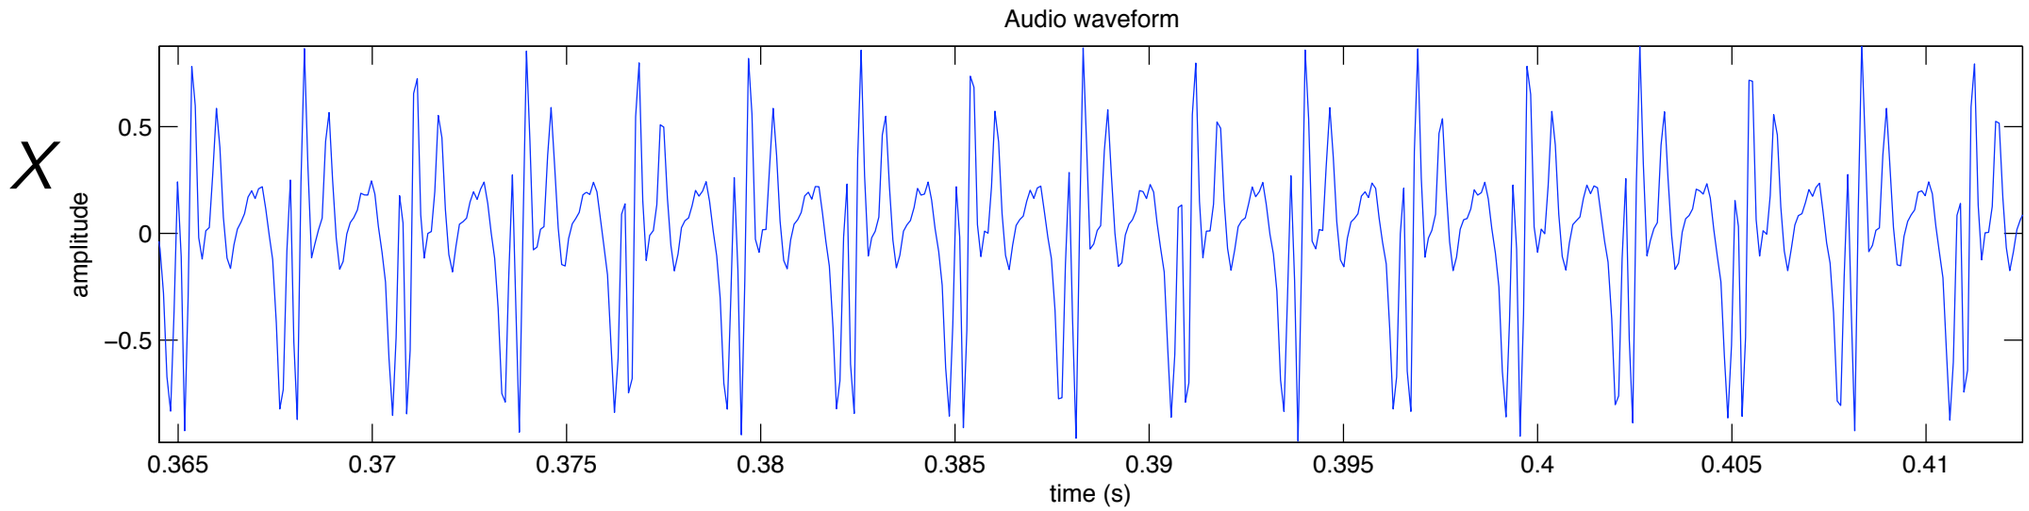


Bogert, Healy, Tukey. The quefrency alanysis of time series for echoes: cepstrum, pseudo-autocovariance, cross-cepstrum, and saphe cracking. Symposium on Time Series Analysis, Chapter 15, 209-243, Wiley, 1963.

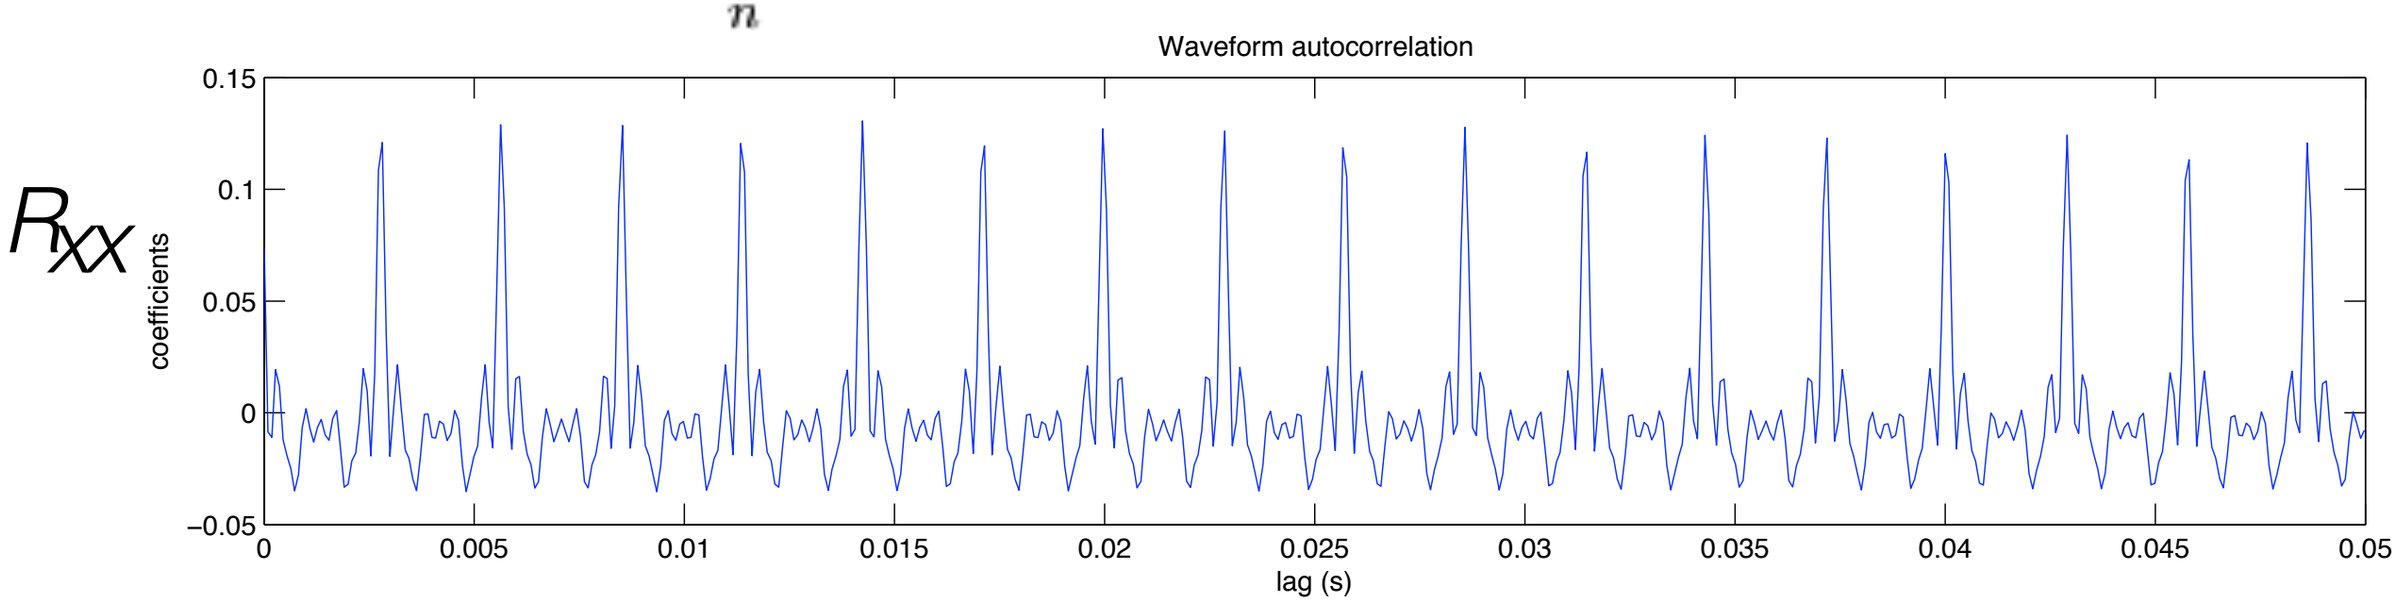
sig.cepstrum cepstral analysis

- *sig.cepstrum(…, '**Freq**')*
  - represented in the frequency domain
- *sig.cepstrum(..., 'Min', 0, 's')*
- *sig.cepstrum(..., 'Max', .05, 's')*

sig.autocor
autocorrelation function



$$R_{xx}(j) = \sum_n x_n \overline{x}_{n-j} \ .$$



sig.autocor
autocorrelation function

- *sig.autocor(…, '**Min**', t1, 's') t1=0 s*
- *sig.autocor(…, '**Max**', t2, 's') t2=.05 s (audio) or t2=2 s (envelope)*
- *sig.autocor(…, '**Freq**') lags in Hz.*
- *sig.autocor(…, '**Window**',w) w='hanning'*
  specifies a windowing method
- *sig.autocor(…, '**NormalWindow**',f)* f='on'='yes'=1
  divides by autocorrelation of the window*****
- *sig.autocor(…, 'Halfwave')* half-wave rectification

*****Boersma. Accurate short-term analysis of the fundamental frequency and the harmonics-to-noise ratio of a sampled sound, IFA Proceedings 17: 97-110, 1993.

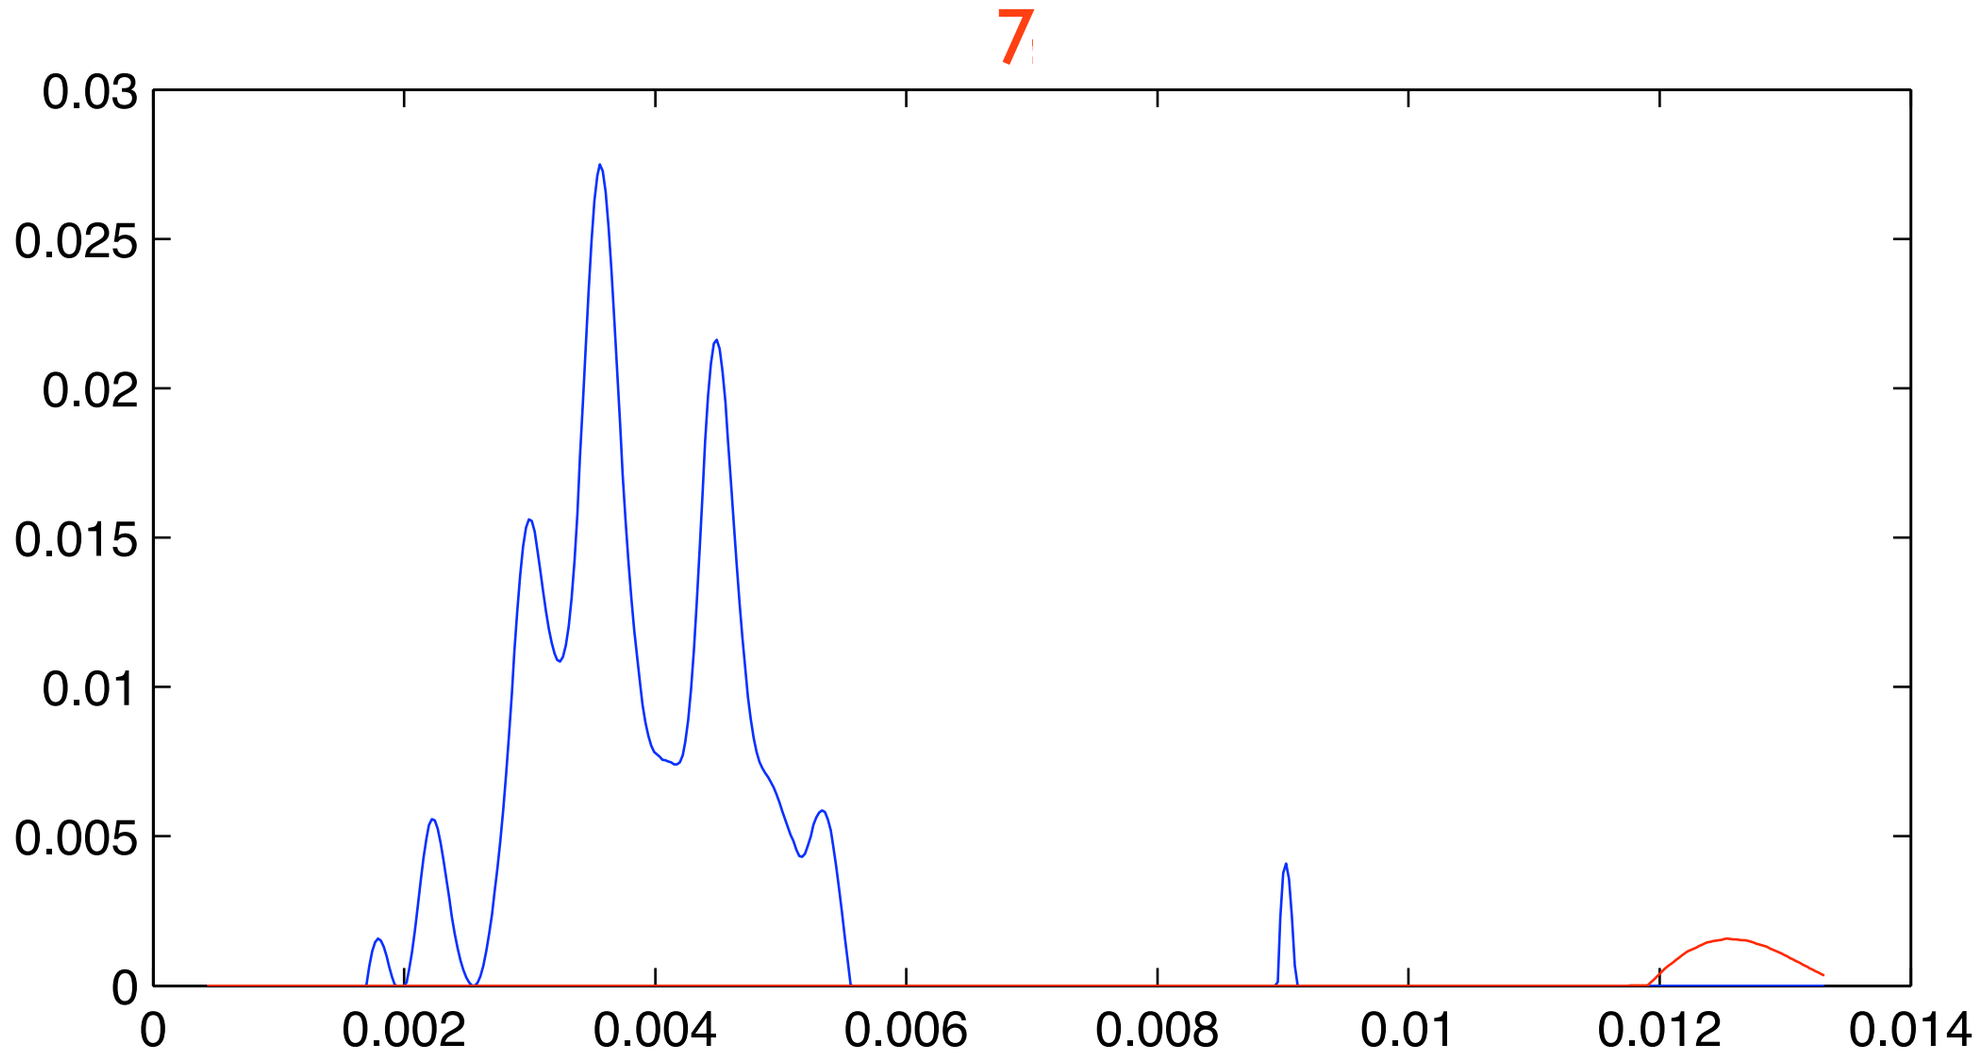
sig.autocor
generalized autocorrelation

- Autocorrelation (by default):
  - $y = IDFT(|DFT(x)|^2)$
- Generalized autocorrelation:
  - $y = IDFT(|DFT(x)|^{\boldsymbol{k}})$
- *sig.autocor(…, '**Compress**', k)* k=.67

Tolonen, Karjalainen. A Computationally Efficient Multipitch Analysis Model, IEEE Transactions on Speech and Audio Processing, 8(6), 2000.

sig.autocor
generalized autocorrelation

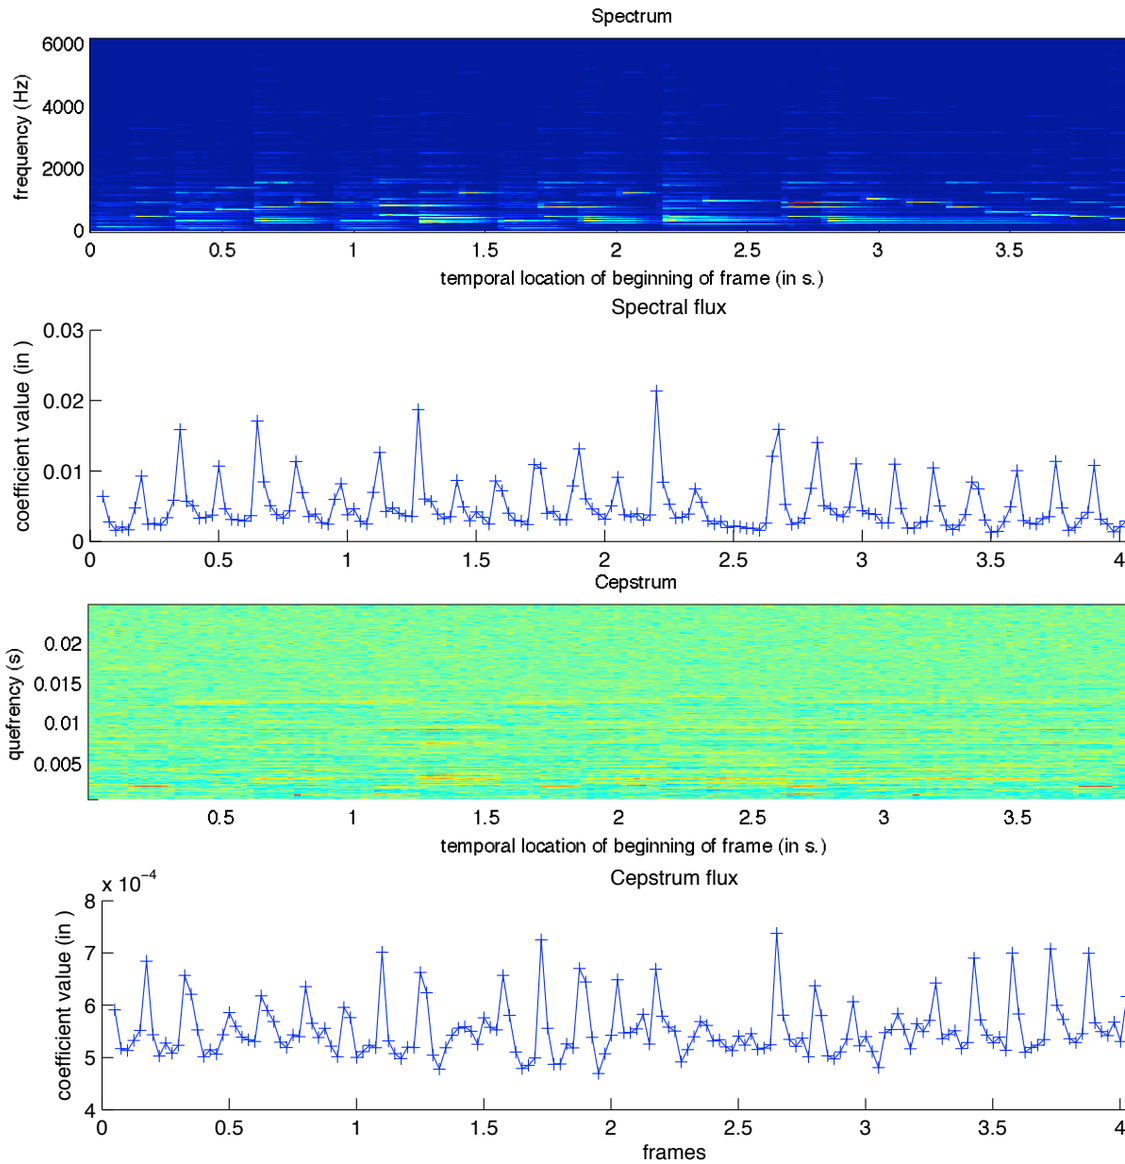
- *sig.autocor('Amin3', 'Enhanced', 2:10)*



Tolonen, Karjalainen. A Computationally Efficient Multipitch Analysis Model, IEEE Transactions on Speech and Audio Processing, 8(6), 2000.

sig.flux: distance between successive frames

- *s = sig.spectrum(a, 'Frame')*
- *sig.flux(s) = sig.flux(a)*
- *c = sig.cepstrum(a, 'Frame')*
- *sig.flux(c)*



sig.flux: distance between successive frames

- *sig.flux(…, '**Dist**',* d*)* d = *'Euclidian', 'City', 'Cosine'* specifies the distance measure.
- *sig.flux(..., '**Inc**')* positive differences
- *sig.flux(..., '**Complex**')* complex flux
- *sig.flux(..., '**Median**', l, C)*
- *sig.flux(..., '**Median**', l, C, '**Halfwave**')*

Audio level

Sound

Dynamics

sig.rms
root-mean square

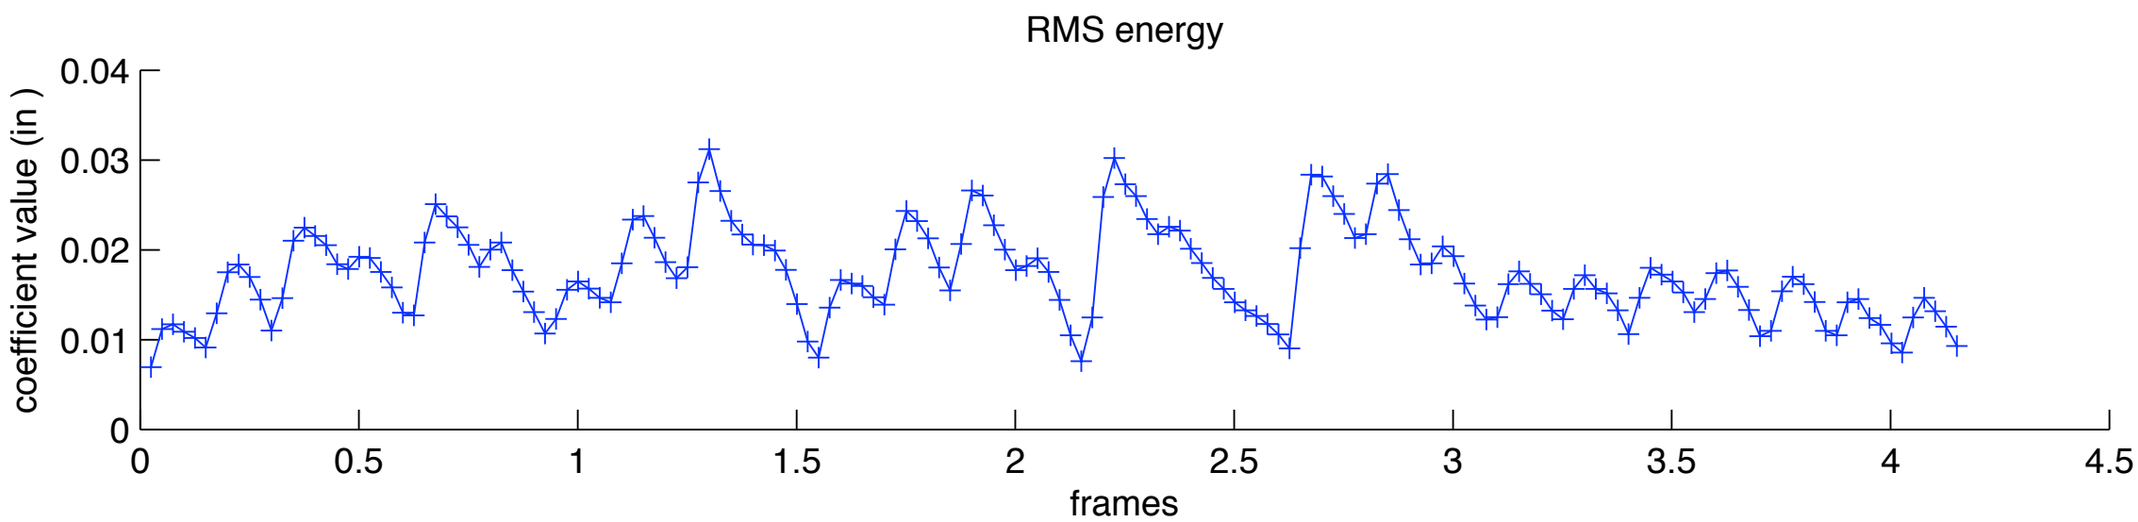
$$x_{\mathrm{rms}} = \sqrt{\frac{1}{n}\sum_{i=1}^{n} x_i^2} = \sqrt{\frac{x_1^2 + x_2^2 + \cdots + x_n^2}{n}}$$

- *sig.rms('ragtime')*

```
The RMS energy related to file ragtime is 0.017932
```

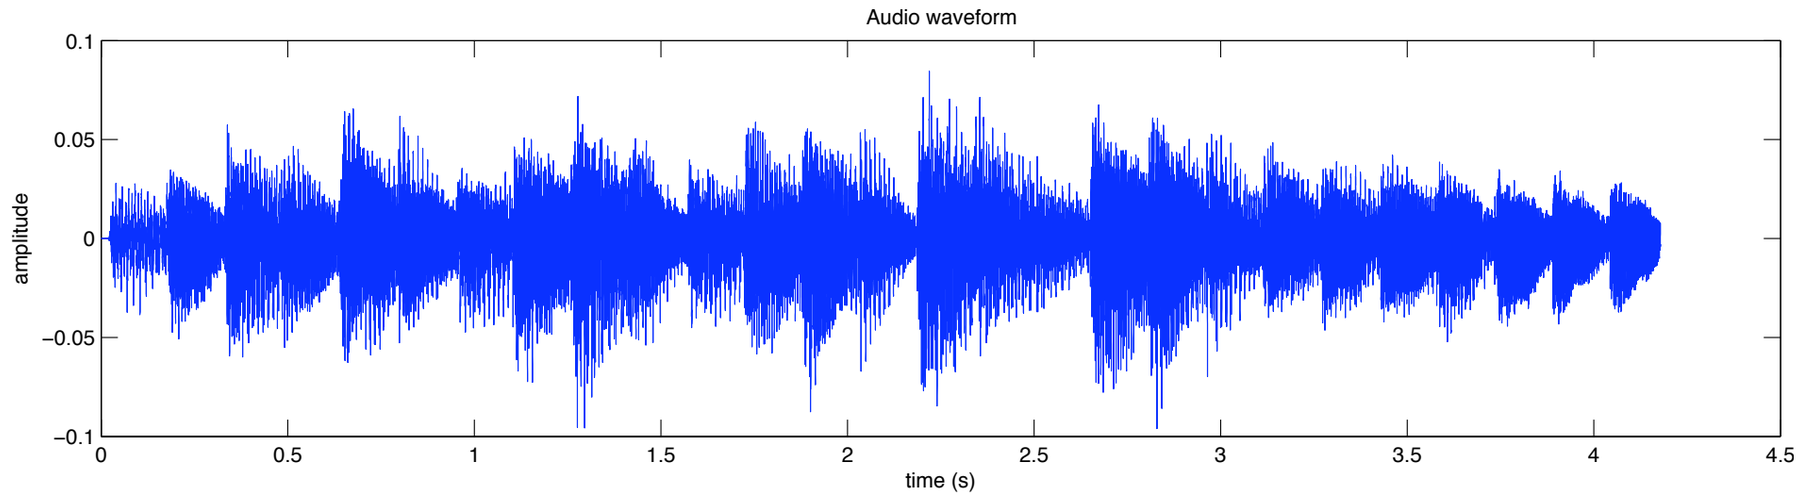
- *sig.rms('ragtime', 'Frame')*

Default frame size .05 s, frame hop = .5

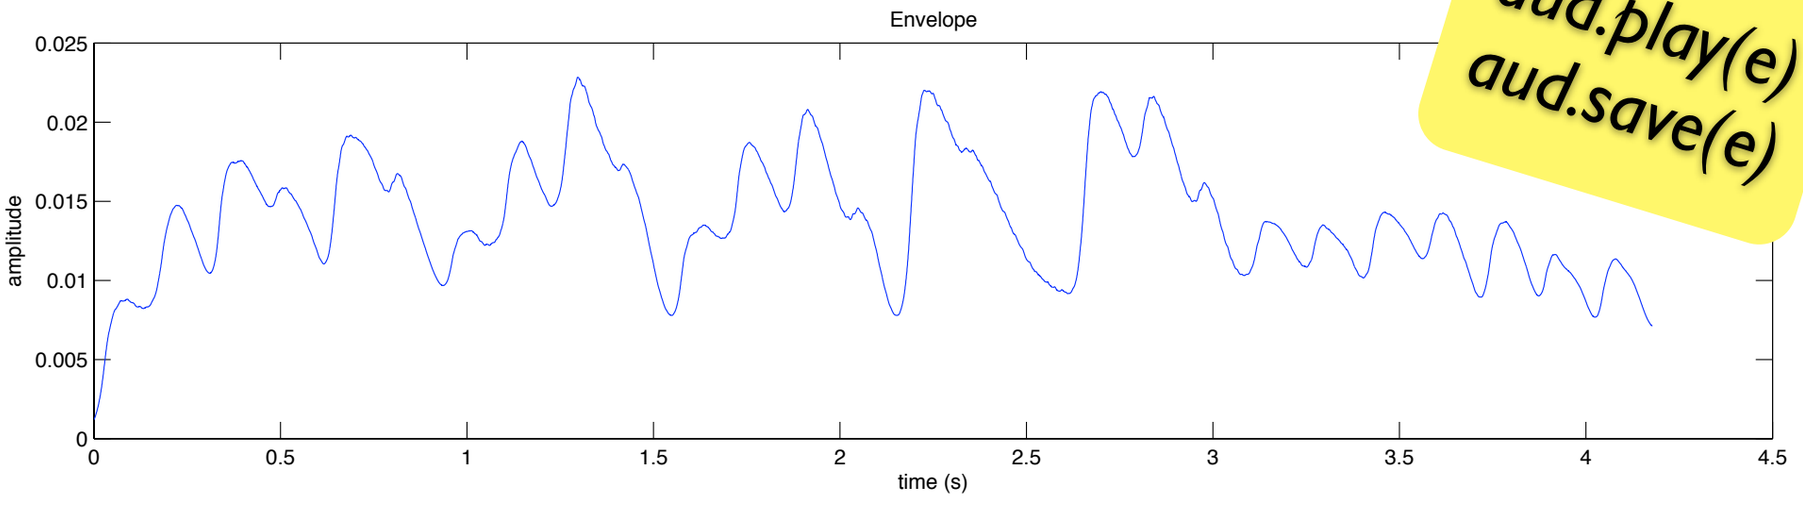


sig.envelope
envelope extraction

- *a:*

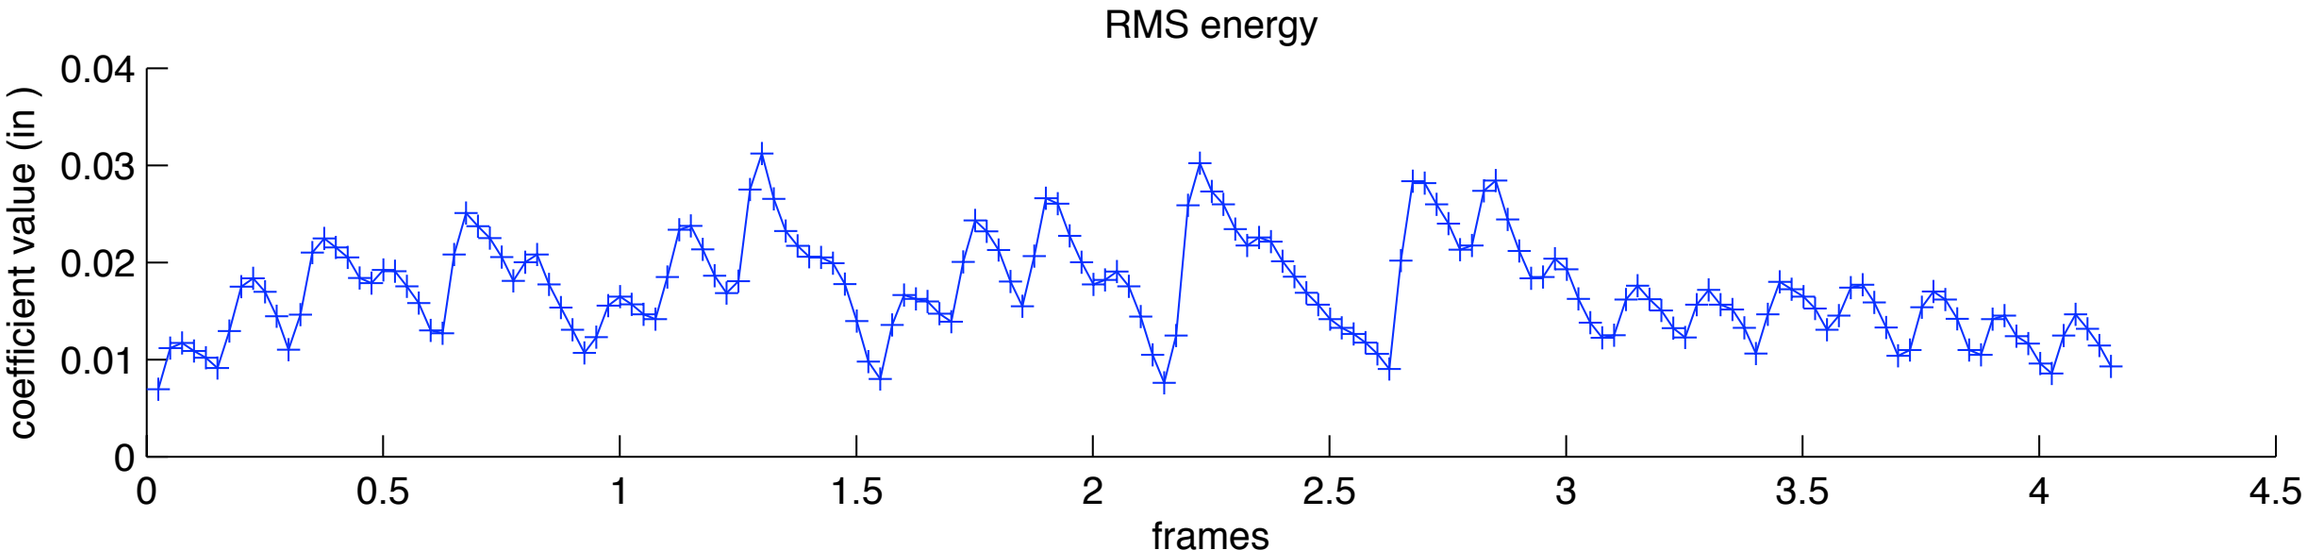


- *e = sig.envelope(a):*

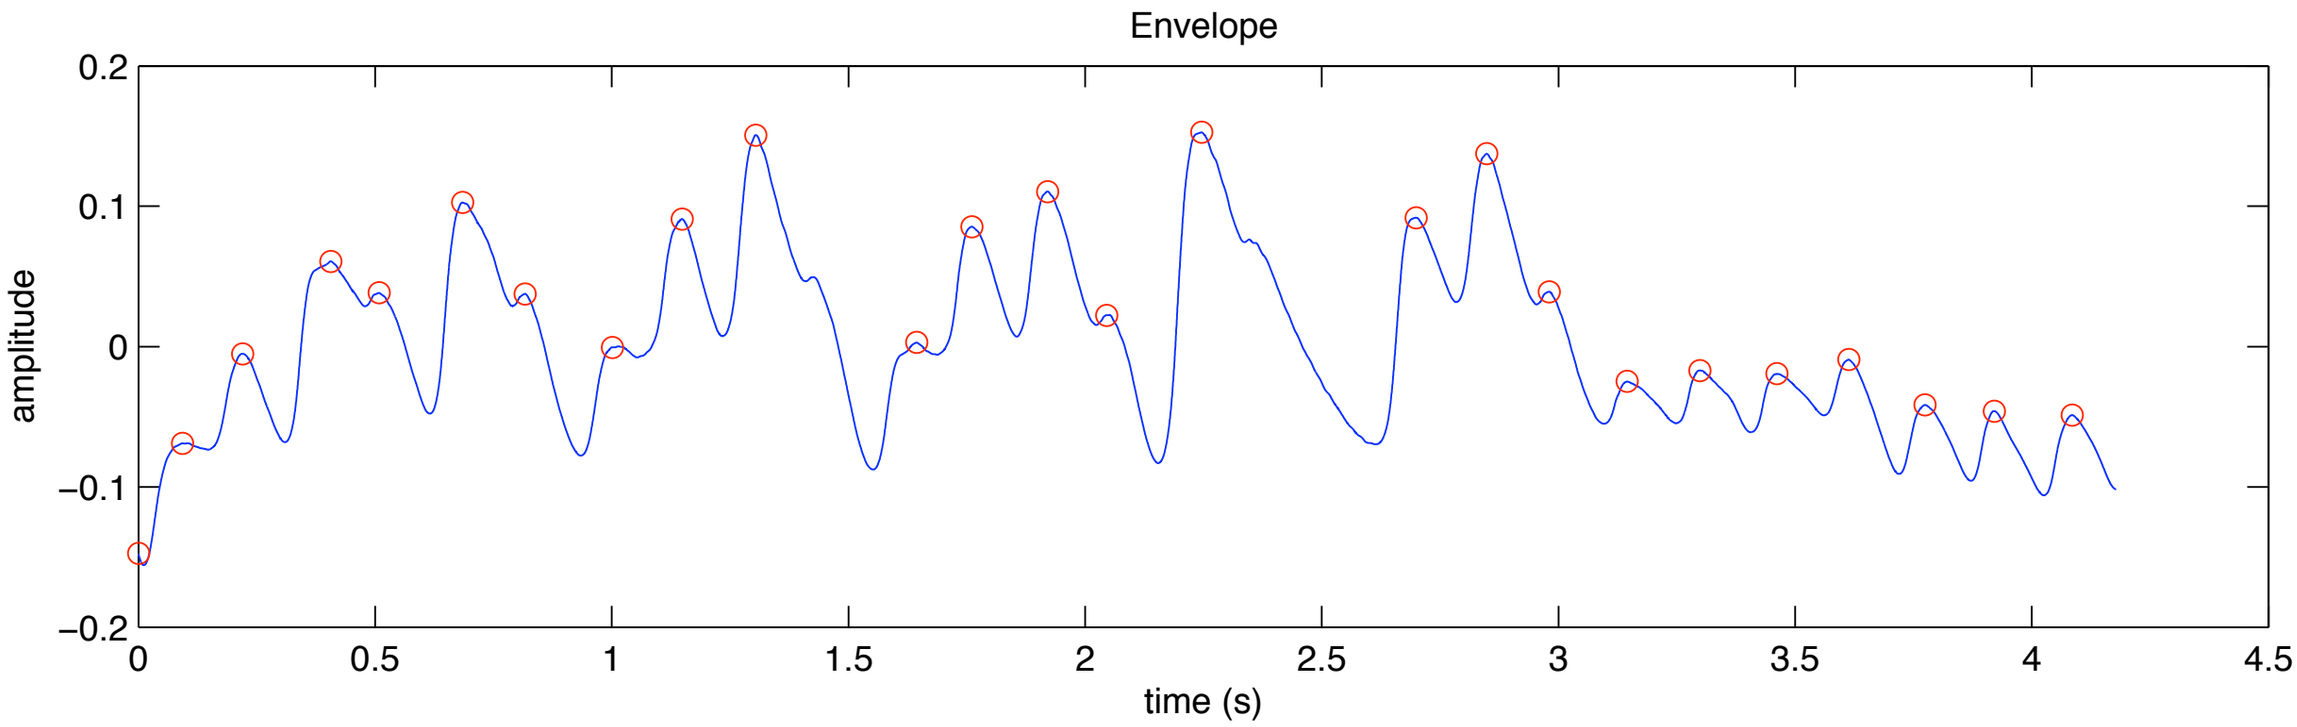


aud.play(e)
aud.save(e)

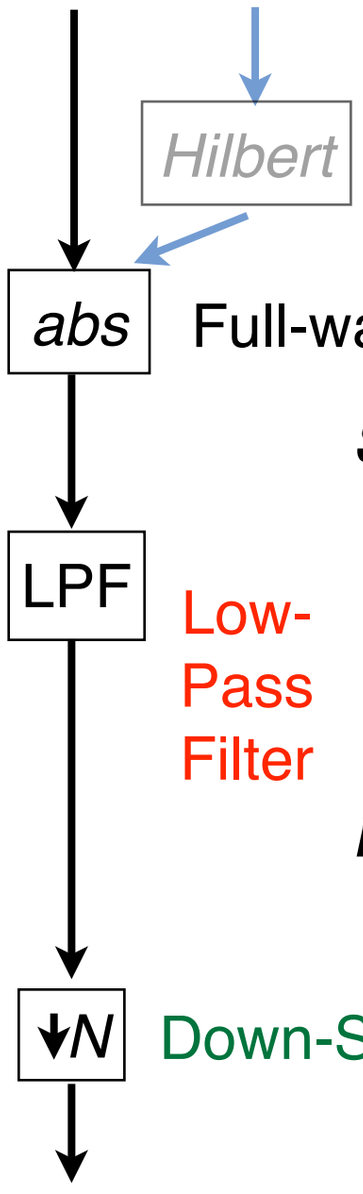
sig.rms



sig.envelope



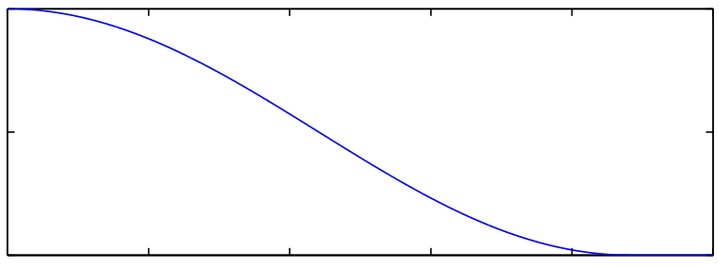
sig.envelope(…, 'Filter') based on low-pass filtering



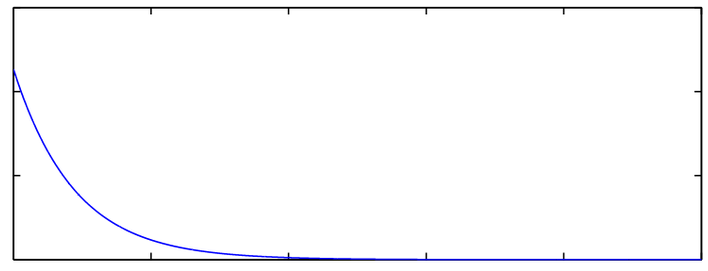
sig.envelope(…, 'Hilbert') (Analytic signal)

Full-wave rectification (Magnitude)

sig.envelope(…, 'IIR')



sig.envelope(…, 'HalfHann')



mirenvelope(…, 'Tau', .02): time constant (in s.)

mirenvelope(…, 'PostDecim', N) *N*=16

mirenvelope(…, 'Sampling', f)

sig.envelope(…, ‘Spectro’) based on power spectrogram

- Band decomposition:
  - *sig.envelope(..., ‘Freq’)*: none (default)
  - *aud.envelope(..., ‘Mel’)*: Mel-band
  - *aud.envelope(..., ‘Bark’)*: Bark-band
- *sig.envelope(…, ‘UpSample’, 2)*
- *sig.envelope(…, ‘Complex’)*

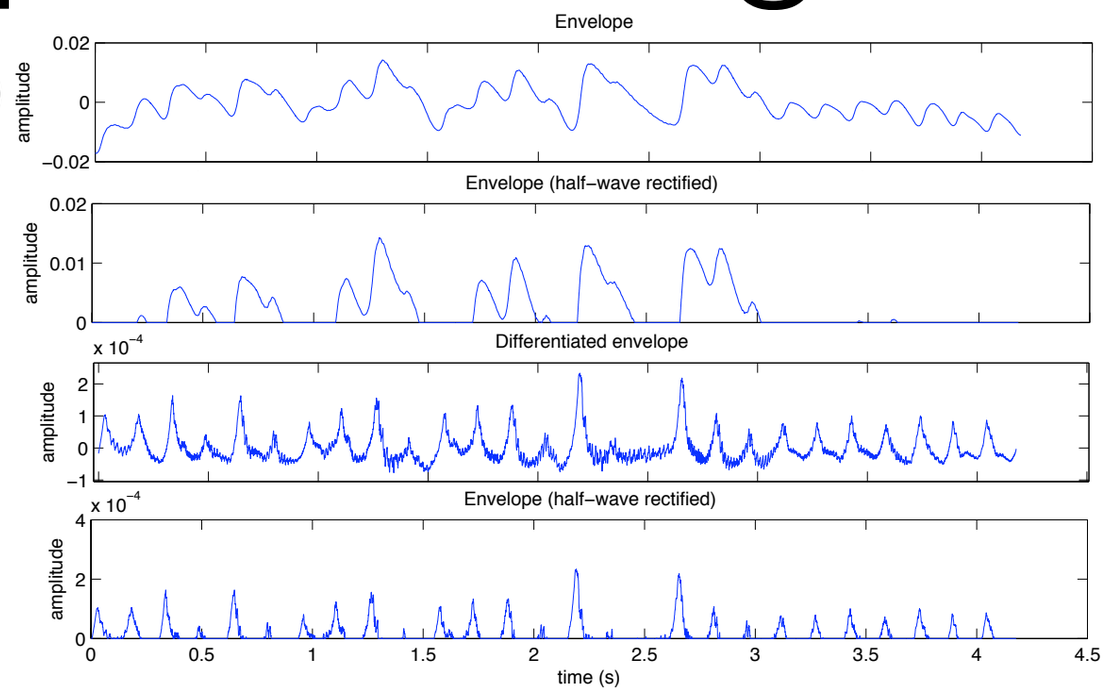
sig.envelope post-processing

- *sig.envelope(…, '**Center**')*

  '***HalfWaveCenter***')

  '***Diff***')

  '***HalfWaveDiff***')



- *sig.envelope(…, '**Power**')*
- *sig.envelope(…, '**Normal**')*
- *sig.envelope(…, '**Smooth**',o)* moving average, order o = 30 sp.
- *sig.envelope(…, '**Gauss**',o)* gaussian, std deviation o = 30 sp.

aud*.envelope*
auditory modeling

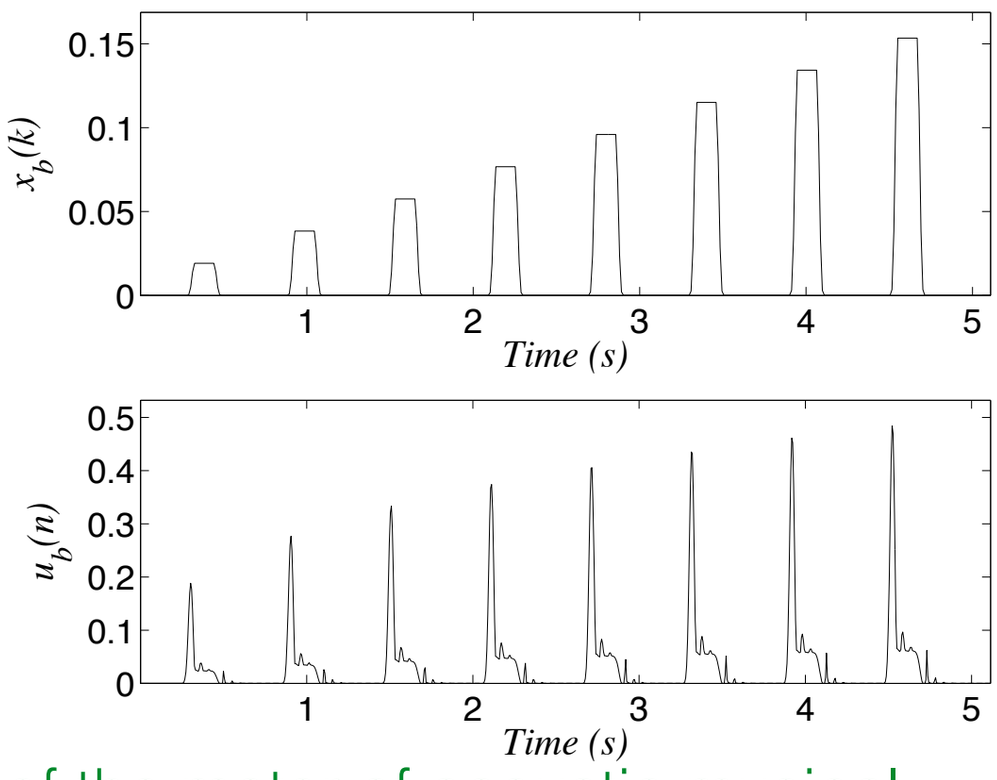
- *aud.envelope(…, ‘Log’,* mu*),*
  mu-law compression, mu = 100

$$y_b(k) = \frac{\ln(1 + \mu x_b(k))}{\ln(1 + \mu)}$$

- *aud.envelope(…, ‘Lambda’,* l*)*

$$u_b(n) = (1 - \lambda) z_b(n) + \lambda \frac{f_r}{f_{\mathrm{LP}}} z_b{}'(n$$

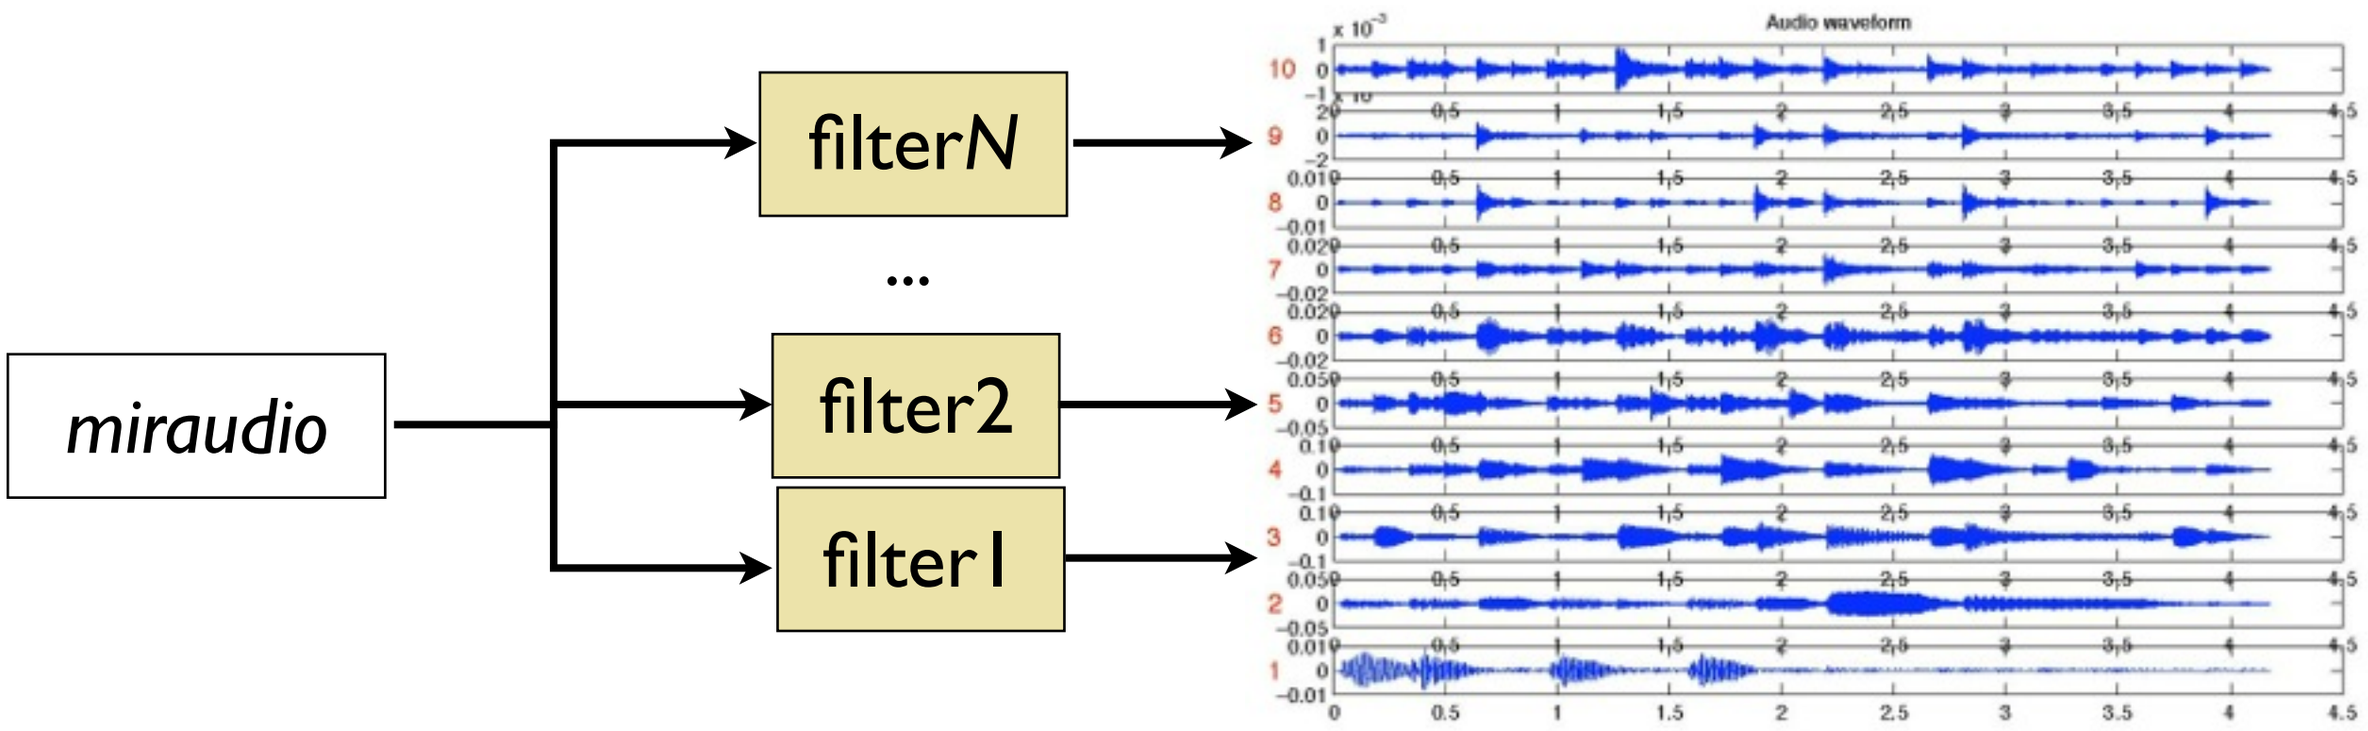
- *aud.envelope(…, ‘Klapuri06’):*
  - *e = aud.envelope(…, ‘Spectro’, ‘UpSample’, ‘Log’, ‘HalfwaveDiff’, ‘Lambda’, .8);*
  - *sig.sum(e, ‘Adjacent’, 10)*



Klapuri, A., A. Eronen and J. Astola. (2006). “Analysis of the meter of acoustic musical signals”, IEEE Transactions on Audio, Speech and Langage Processing, 14-1, 342– 355.

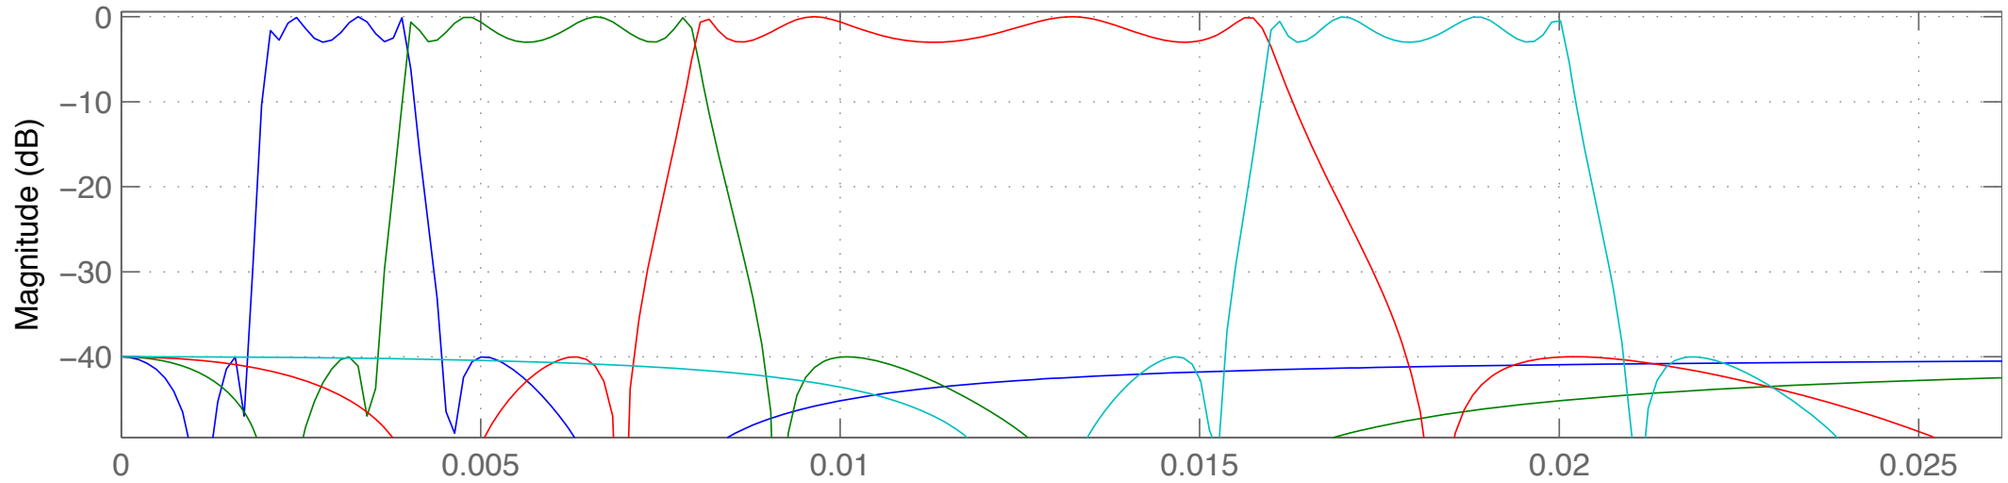
sig.filterbank
filterbank decomposition

- f = sig.filterbank(…, ‘CutOff’, [500, 1000])
- aud.play(f)
- aud.save(f)

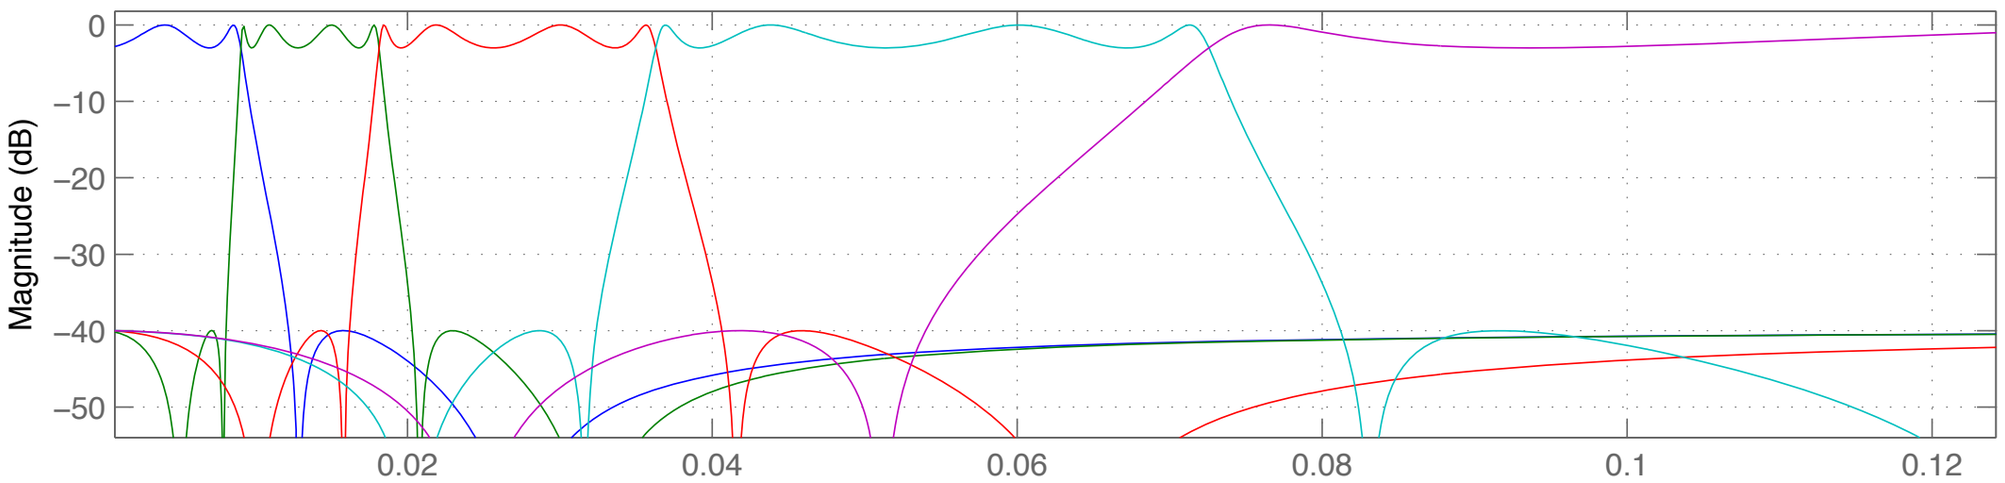


sig.filterbank
filterbank decomposition

sig.filterbank(…, ‘CutOff’, [44, 88, 176, 352, 443])



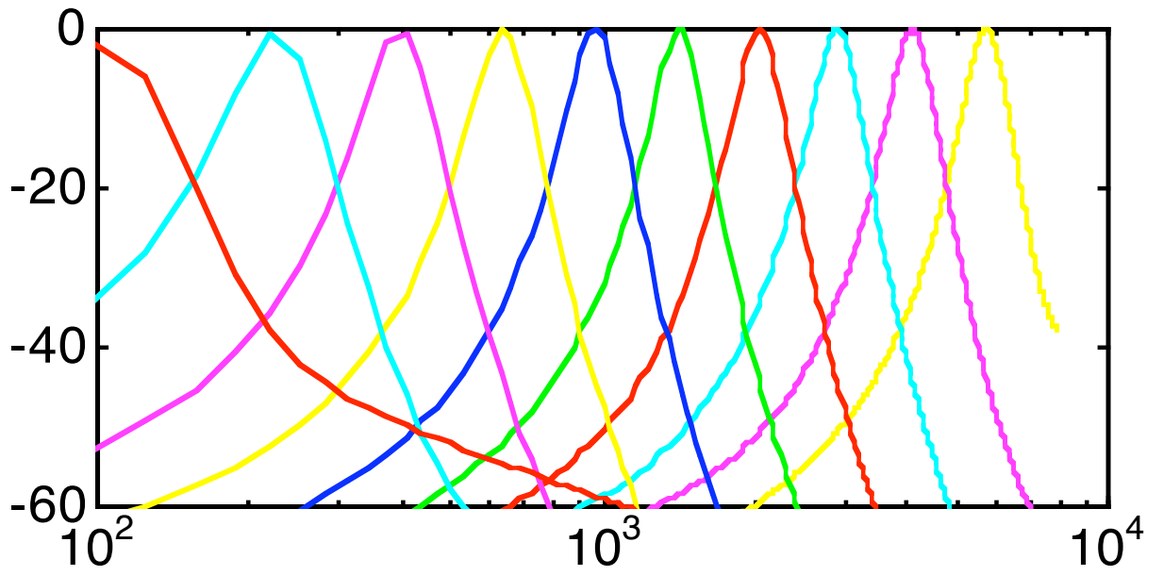
sig.filterbank(…, ‘CutOff’, [-Inf 200 400 800 1600 Inf])



***aud**.filterbank*
auditory modeling

- *aud.filterbank(…)*

- Equivalent Rectangular Bandwidth (ERB) Gammatone filterbank



Filter frequency responses

- *aud.filterbank(…, '**NbChannels**', 10)*

- *aud.filterbank(…, '**Channel**', 1:10)*

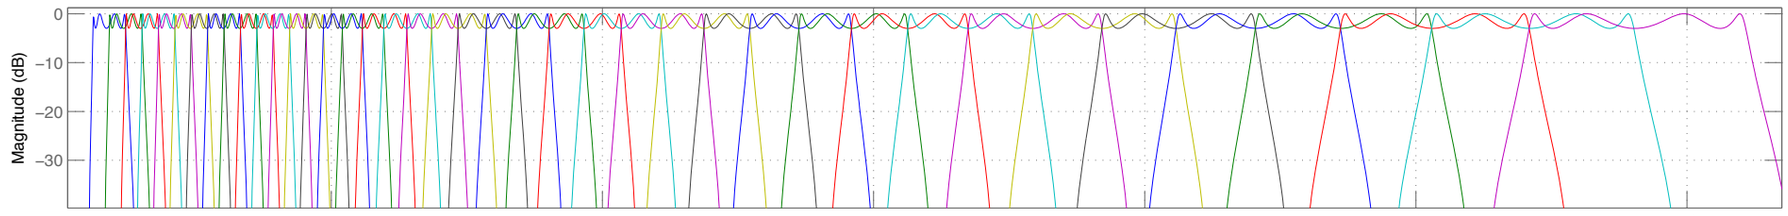
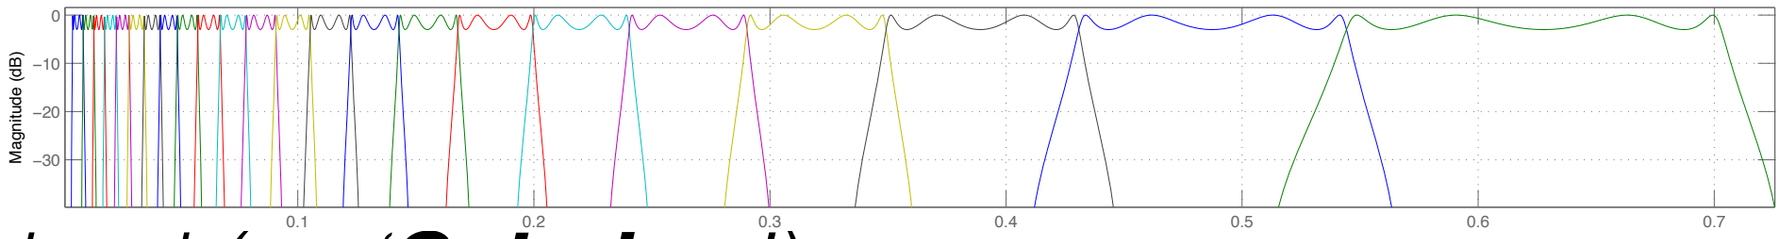
aud*.filterbank*
auditory modeling

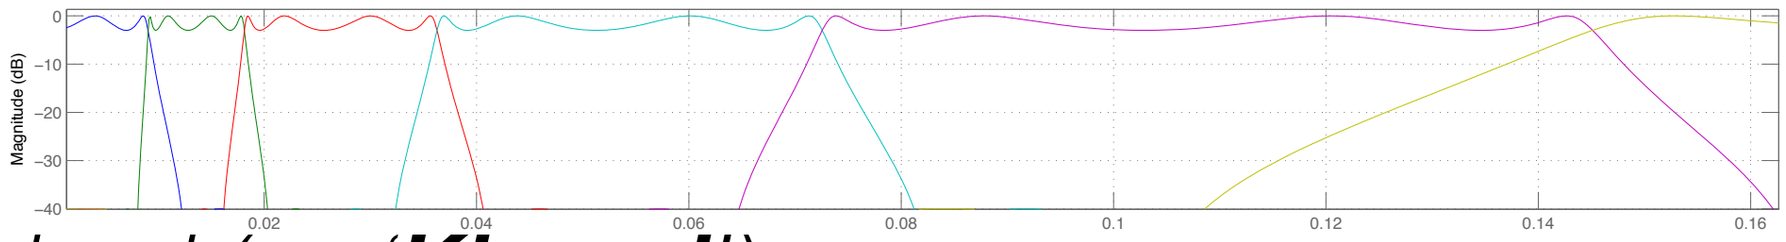
- *aud.filterbank(…, '**Mel**')*



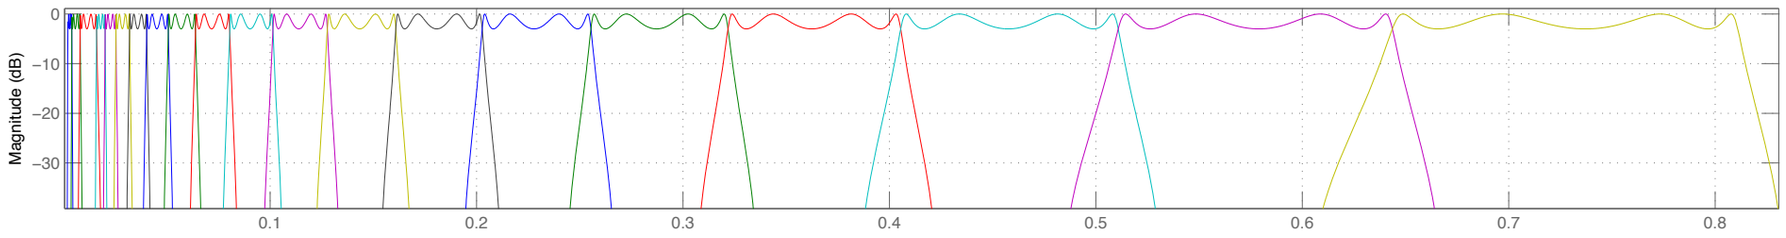
- *aud.filterbank(…, '**Bark**')*



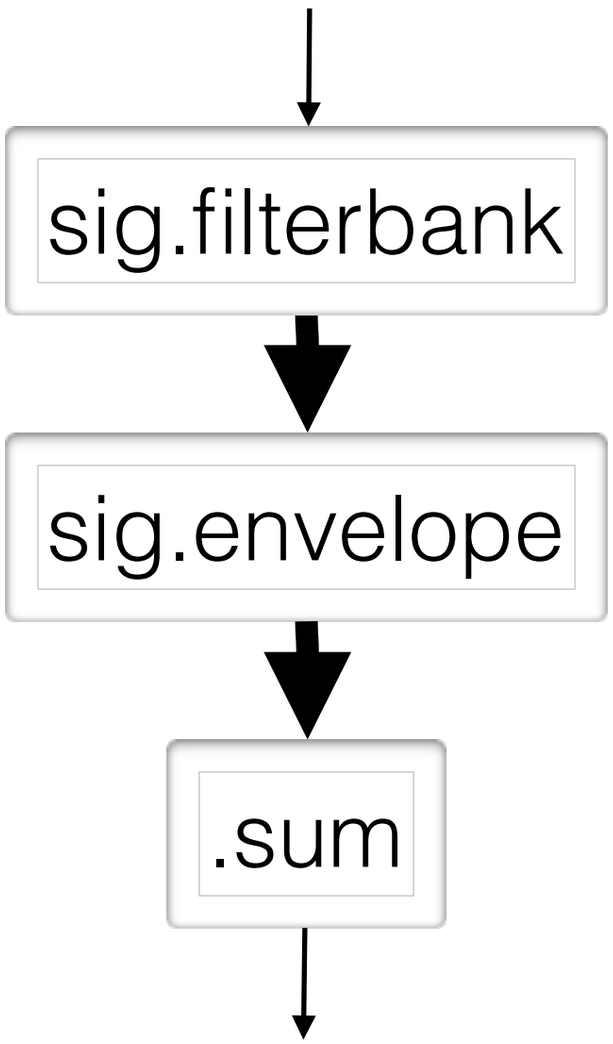
- *aud.filterbank(…, '**Scheirer**')*



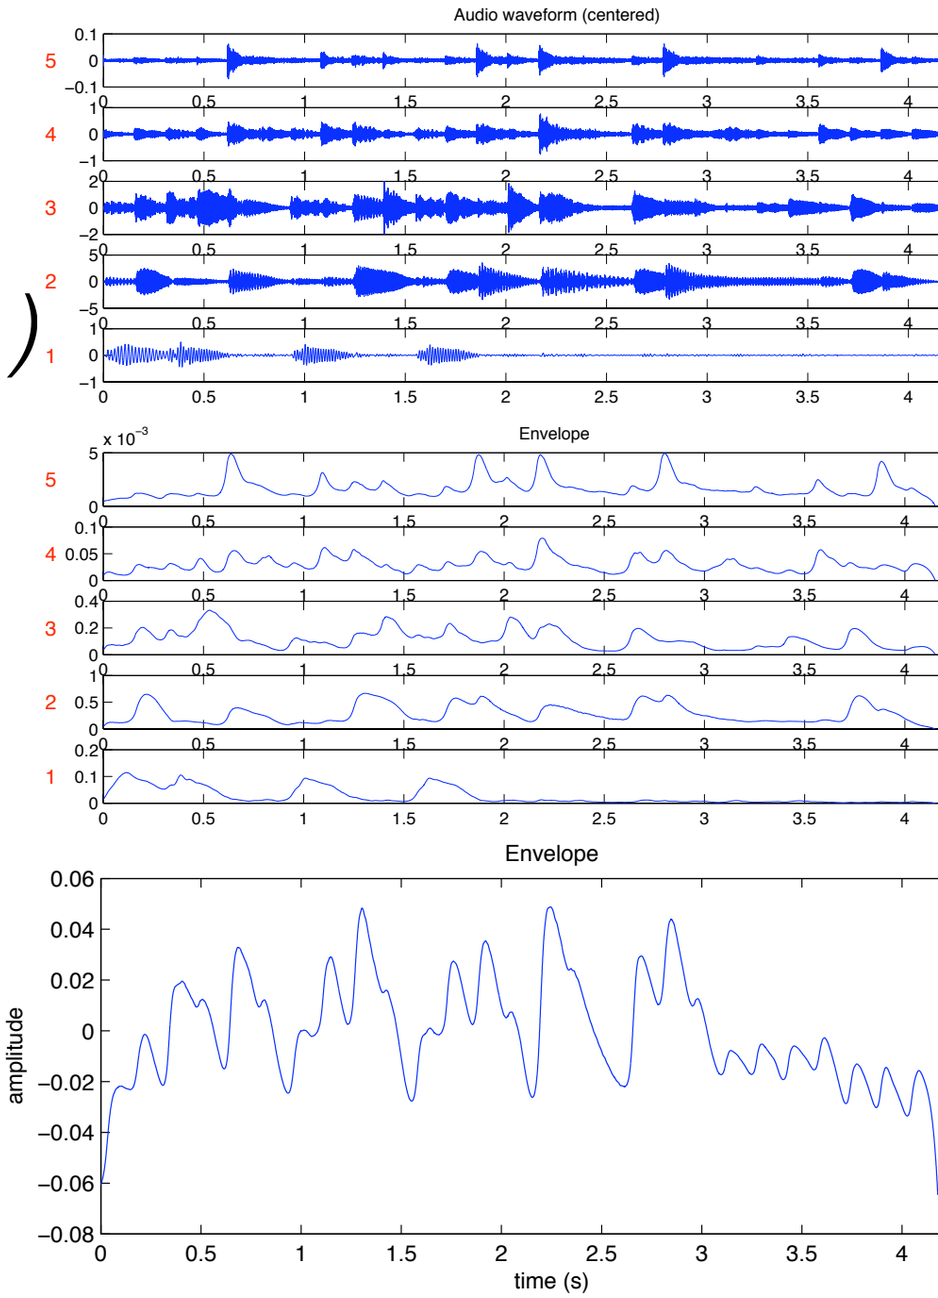
- *aud.filterbank(…, '**Klapuri**')*



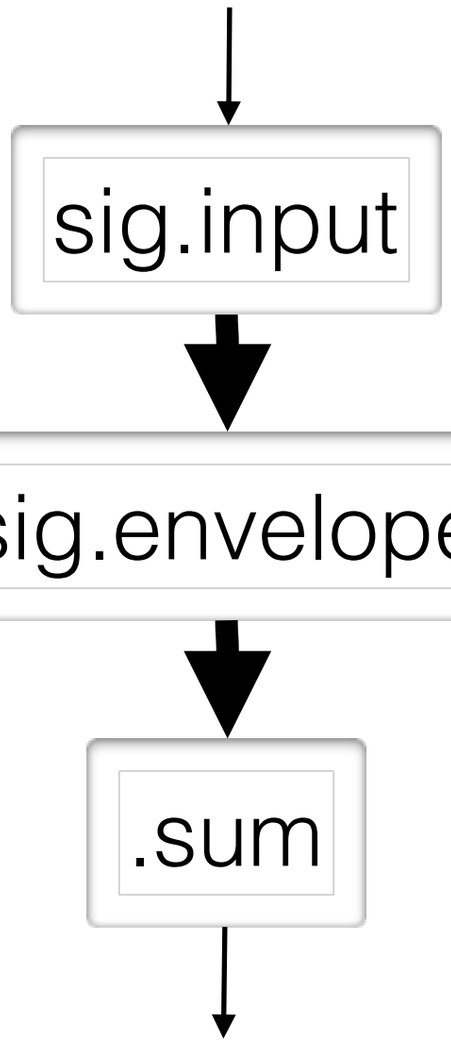
.sum
across-channel summa*tion*



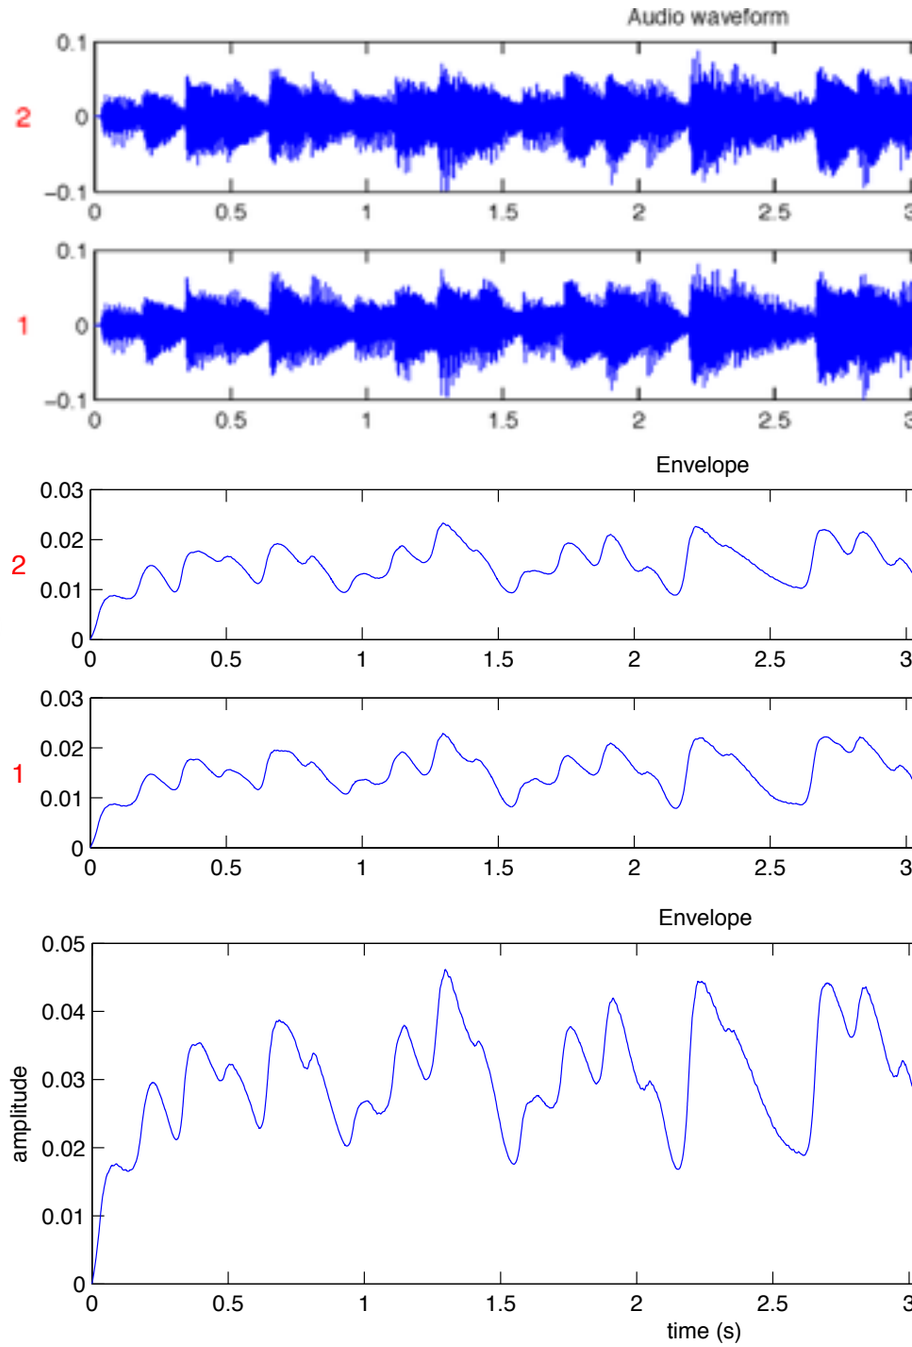
- *f = sig.filterbank(…)*
- *e = sig.envelope(f)*
- *e.sum*



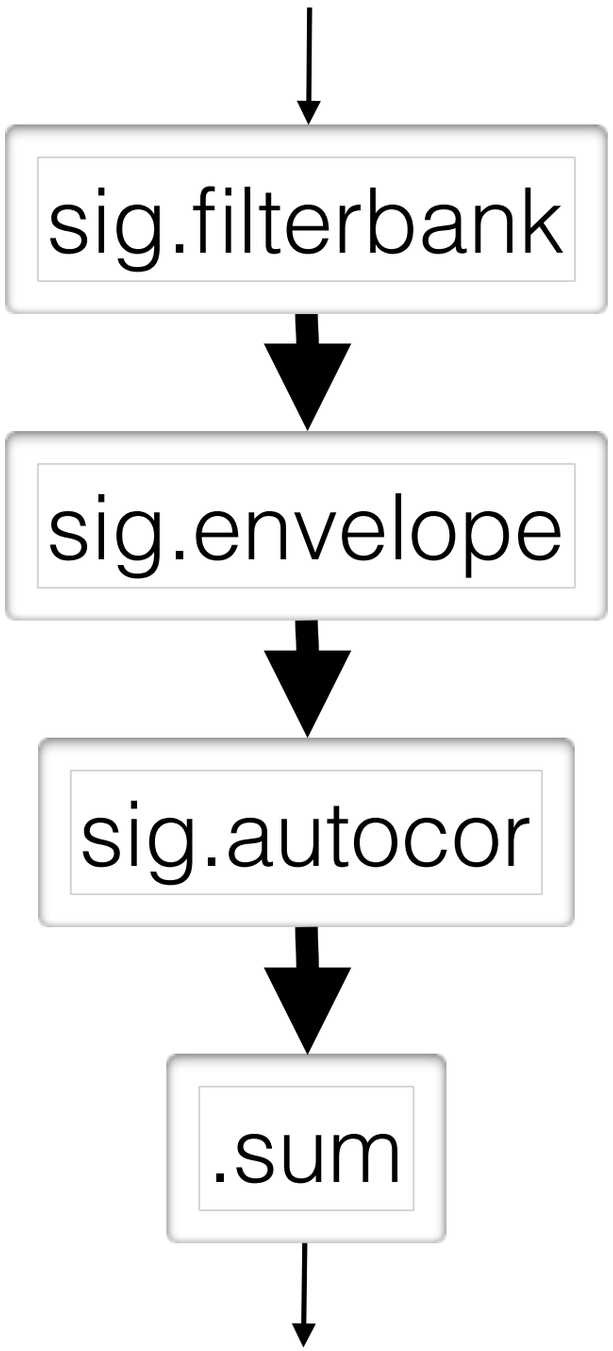
.sum
stereo summa*tion*



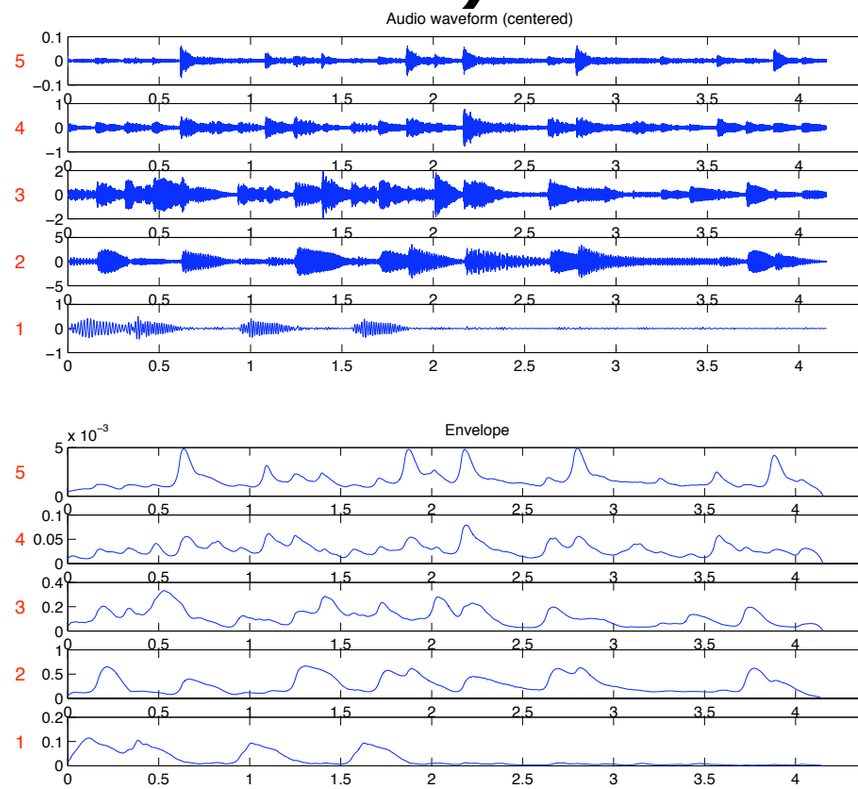
- *a = sig.input(…, ‘Mix’, ‘No’)*
- *e = sig.envelope(a)*
- *e.sum(‘**channel**’)*

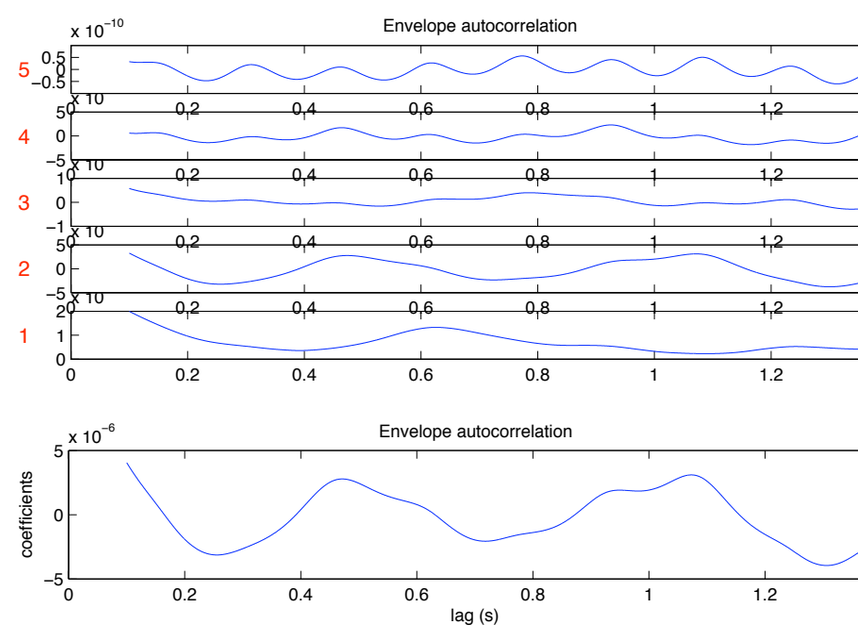


.sum
across-channel summa*ry*

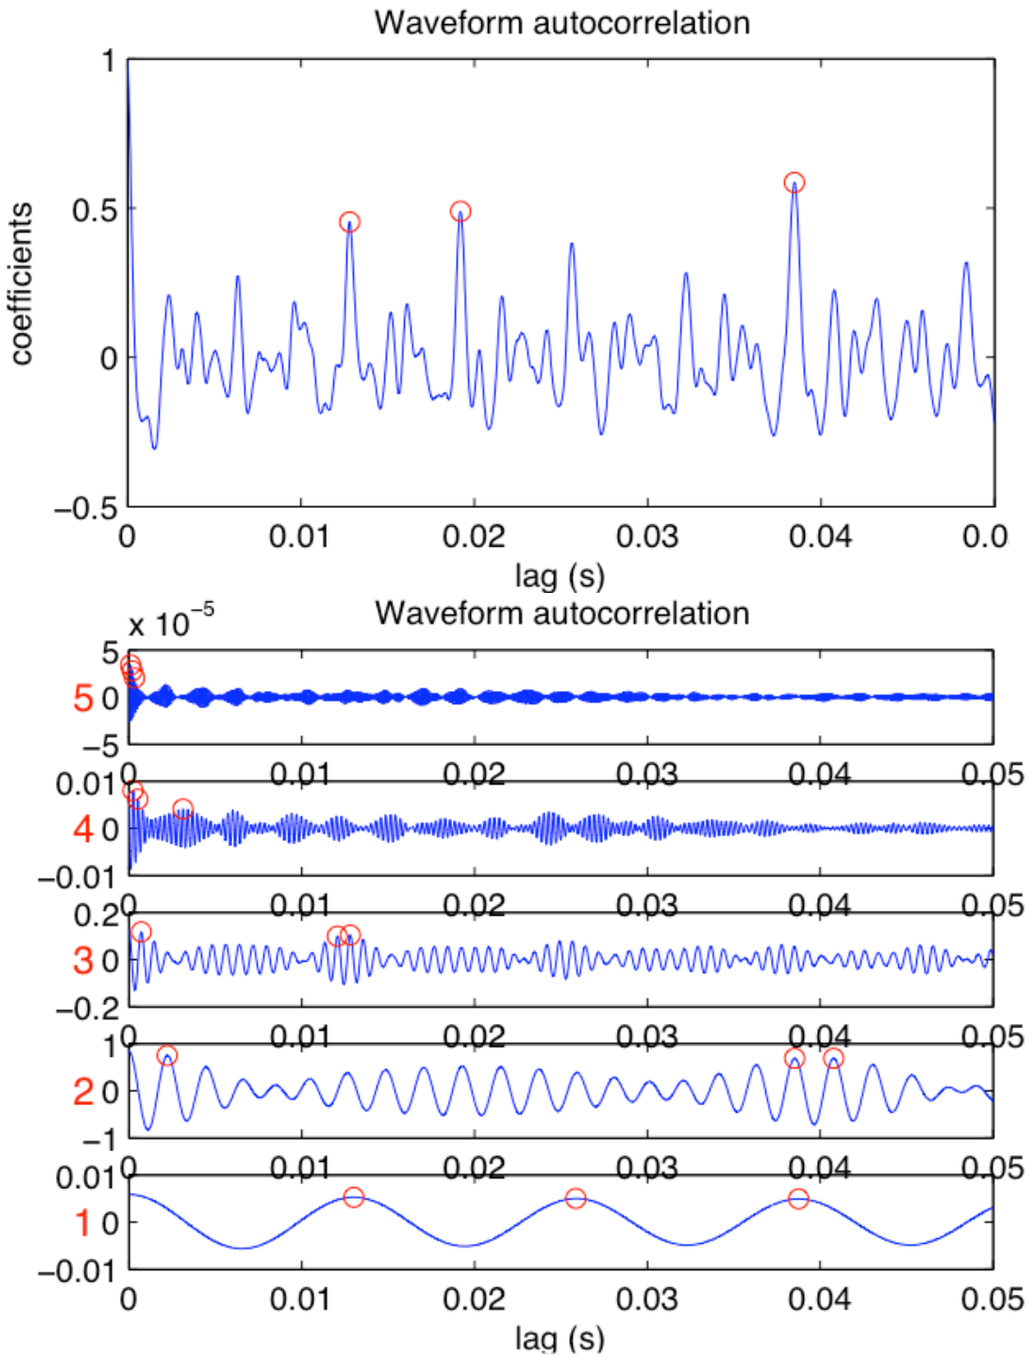


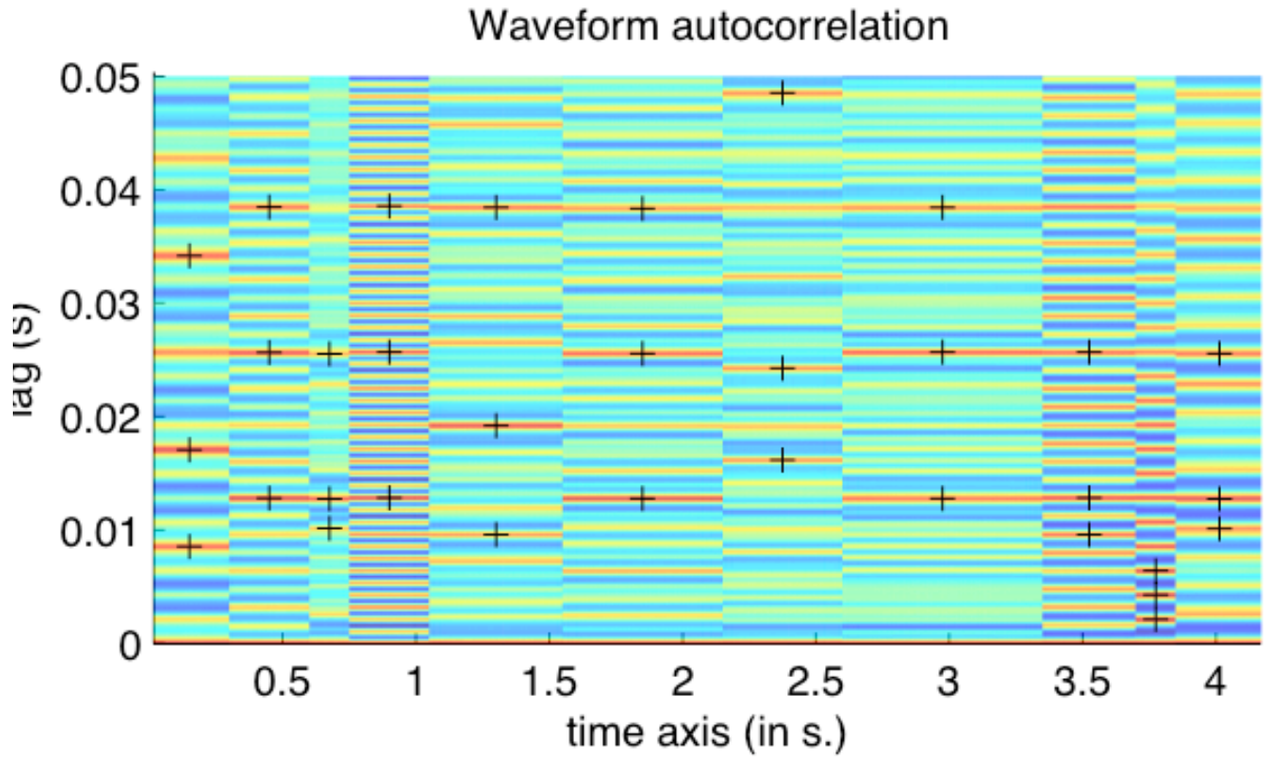
- *f = sig.filterbank(…)*
- *e = sig.envelope(f)*
- *a = sig.autocor(e)*
- *a.sum*





sig.peaks
peak picking

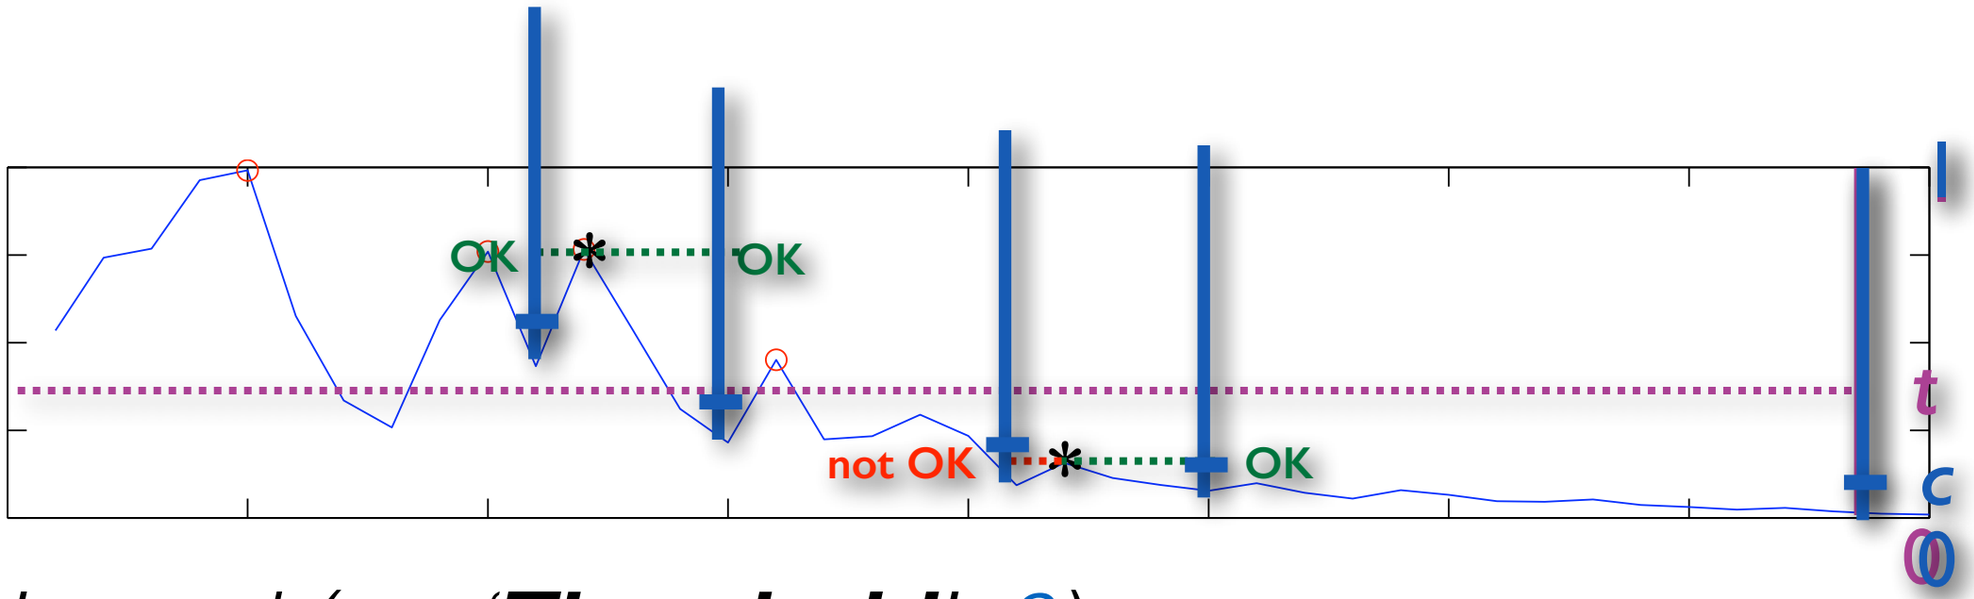




sig.peaks
peak picking

- *sig.peak(…, '**Total**', Inf)* Number of peaks
- Border effects:
  - *sig.peak(…, '**NoBegin**')* First sample excluded
  - *sig.peak(…, '**NoEnd**')* Last sample excluded
- *sig.peak(…, '**Order**', o)* Ordering of peaks
  - o = '***Amplitude***' From highest to lowest
  - o = '***Abscissa***' Along the abscissa axis
- *sig.peak(…, 'Valleys')* Local minima

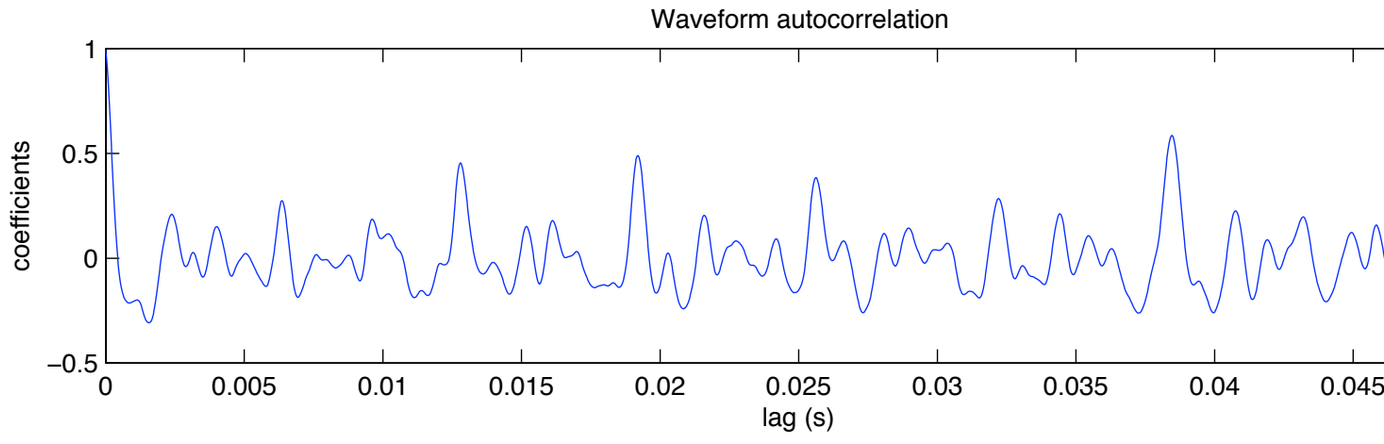
sig.peaks
peak picking



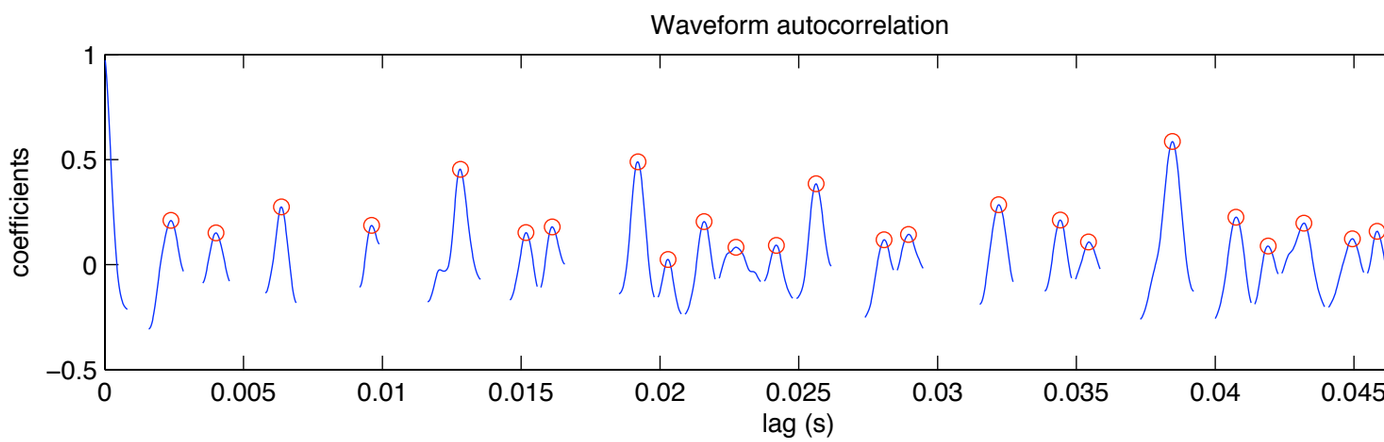
- *sig.peak(…, '**Threshold**', 0)*
- *sig.peak(…, '**Contrast**', .1)*
- *sig.peak(…, '**SelectFirst**', .05)*
- *mus.peak(…, '**Reso**', '**SemiTone**')*

sig.peaks
peak picking

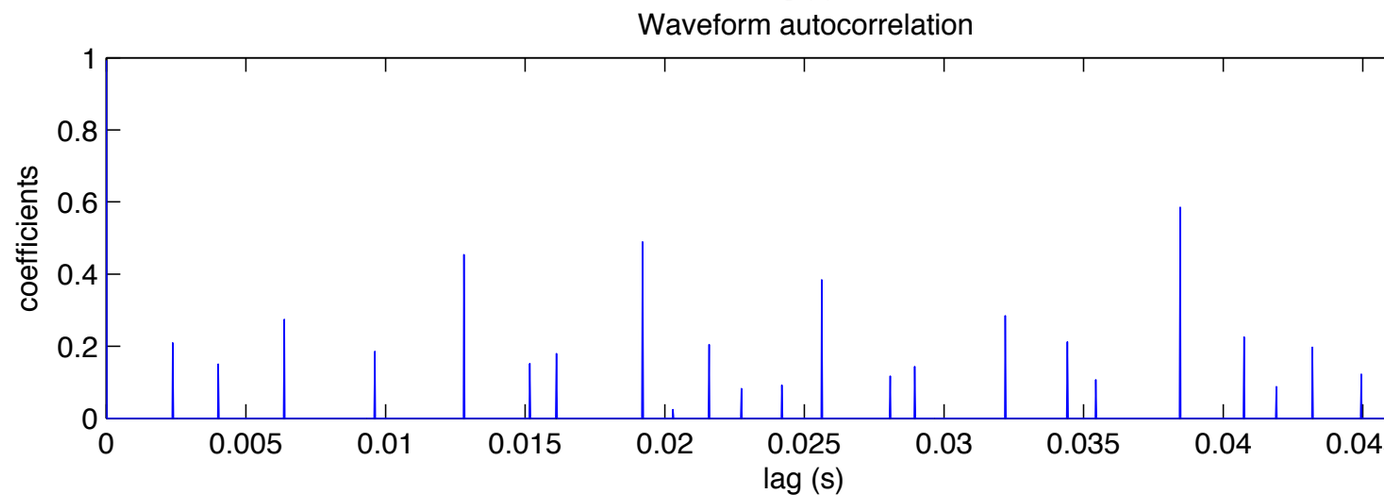
- *sig.peak(…)*



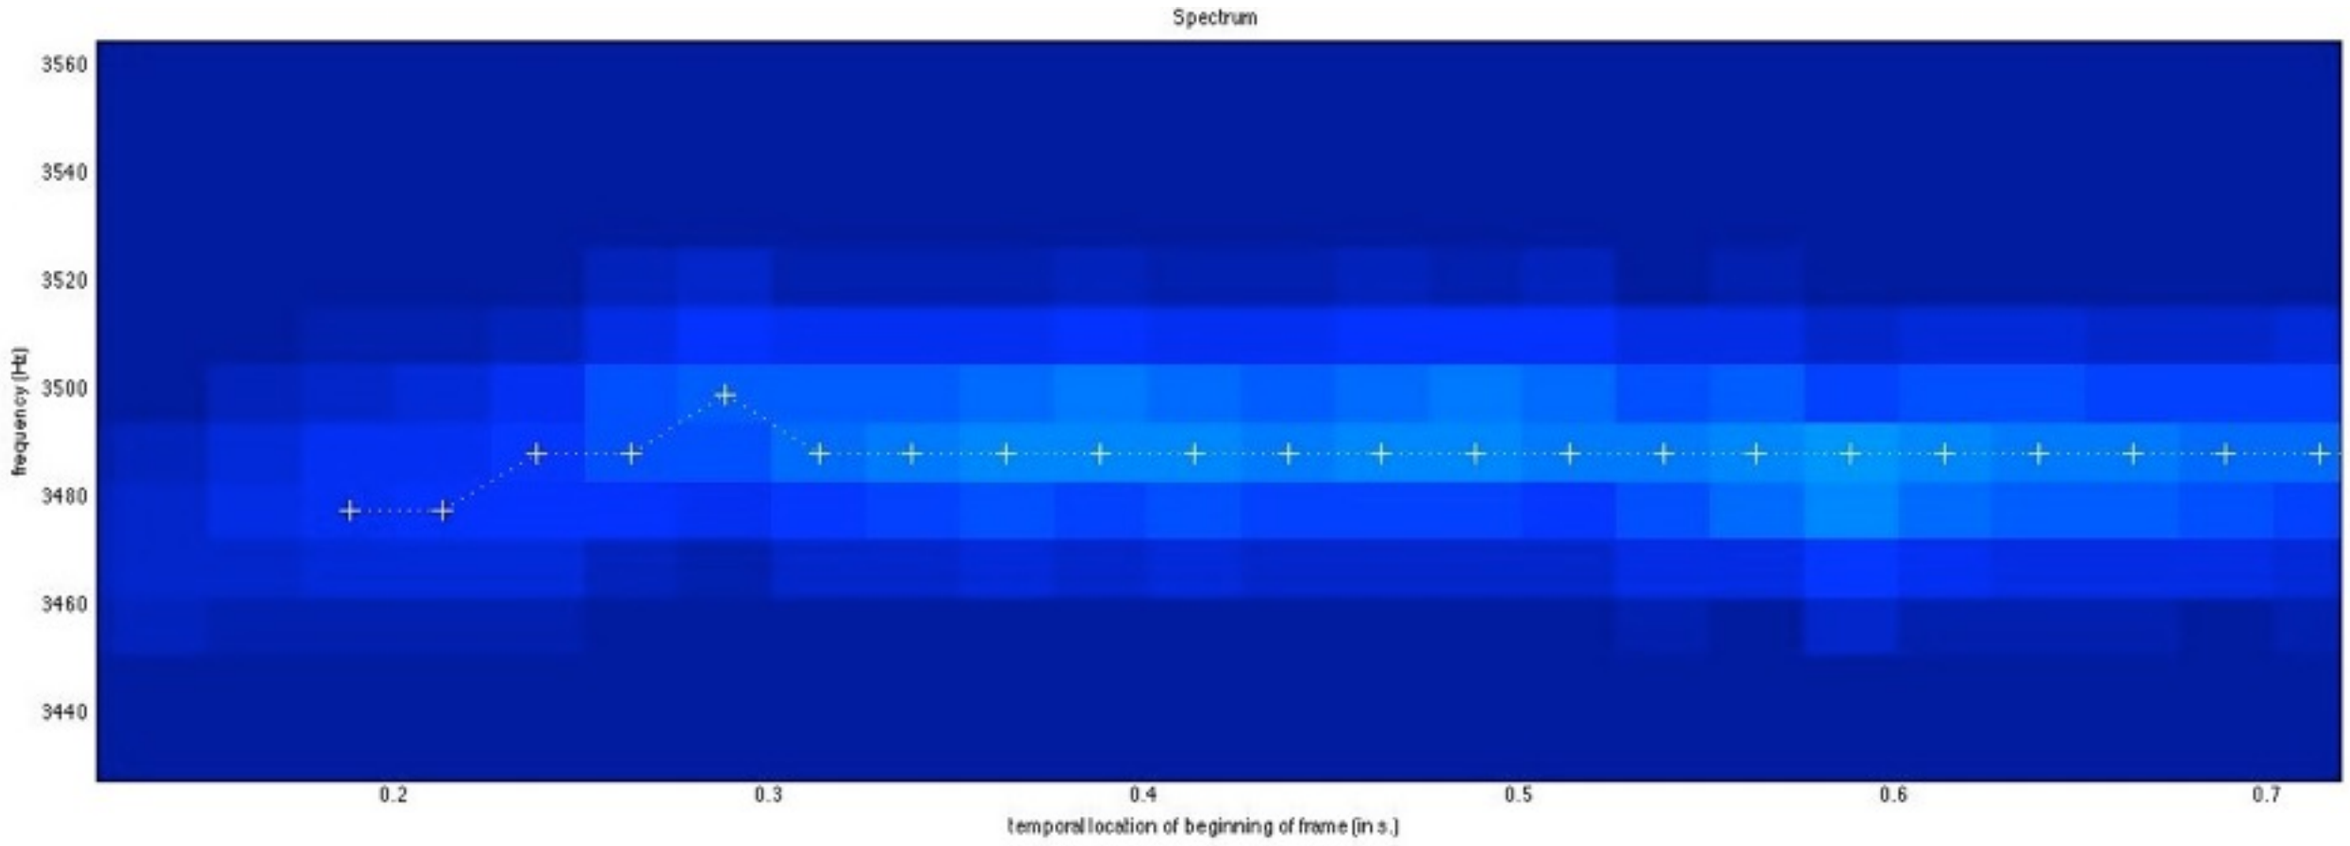
- *sig.peak(…, ‘**Extract**’)*



- *sig.peak(…, ‘**Only**’)*



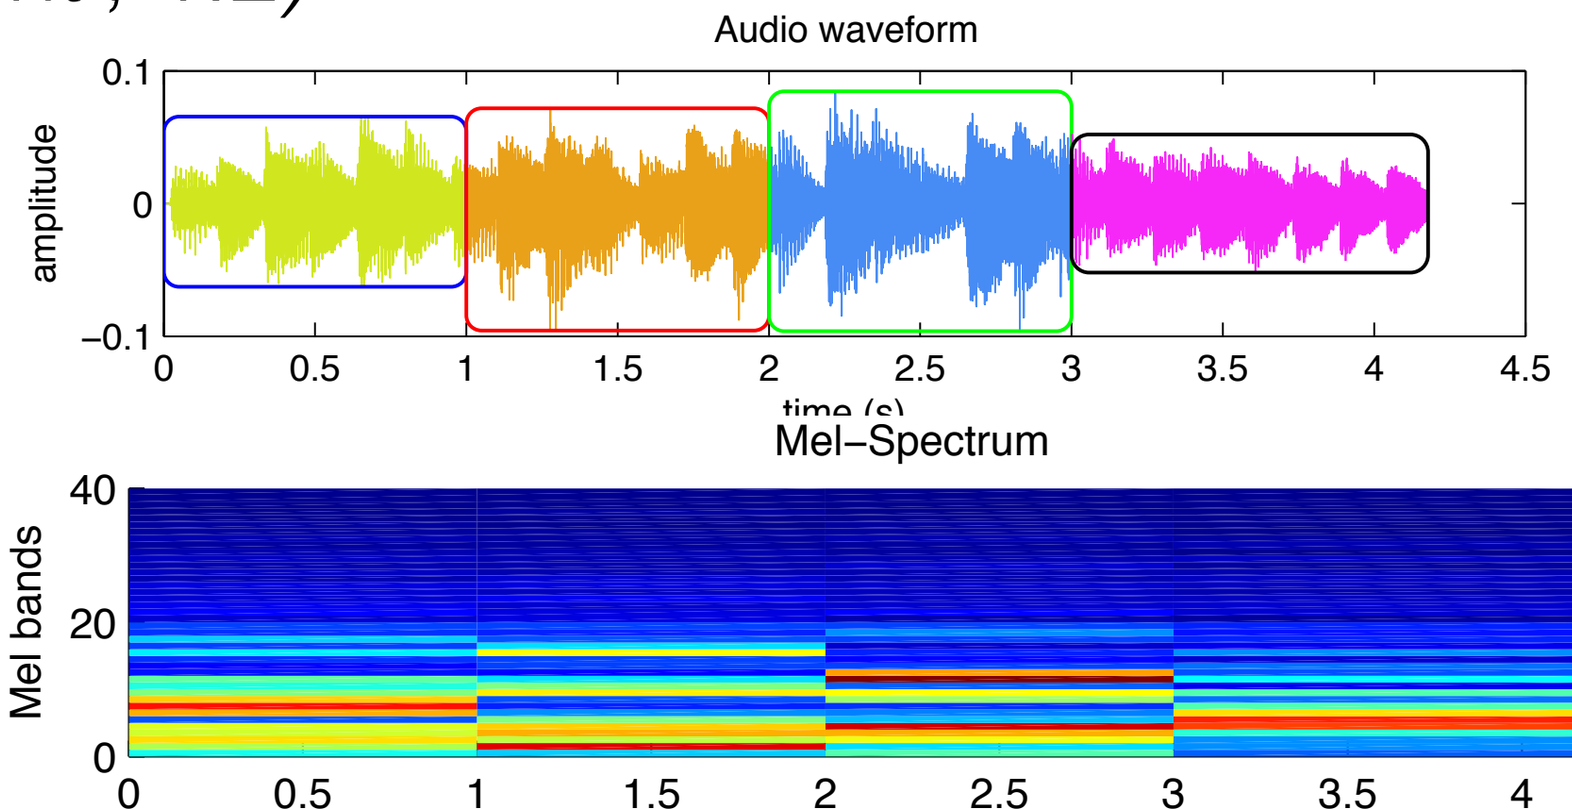
sig.peaks(…, 'Track')
peak tracking



McAulay, R.; Quatieri, T. (1996). "Speech analysis/Synthesis based on a sinusoidal representation", IEEE Transactions on Acoustics, Speech and Signal Processing, 34:4, 744–754.

sig.segment segmentation

- *s = sig.segment('myfile', [1 2 3])*
- *aud.play(s, 'Segment', 1:2)*
- *aud.save(s)*
- *sig.spectrum(s)*



sig.segment
segmentation

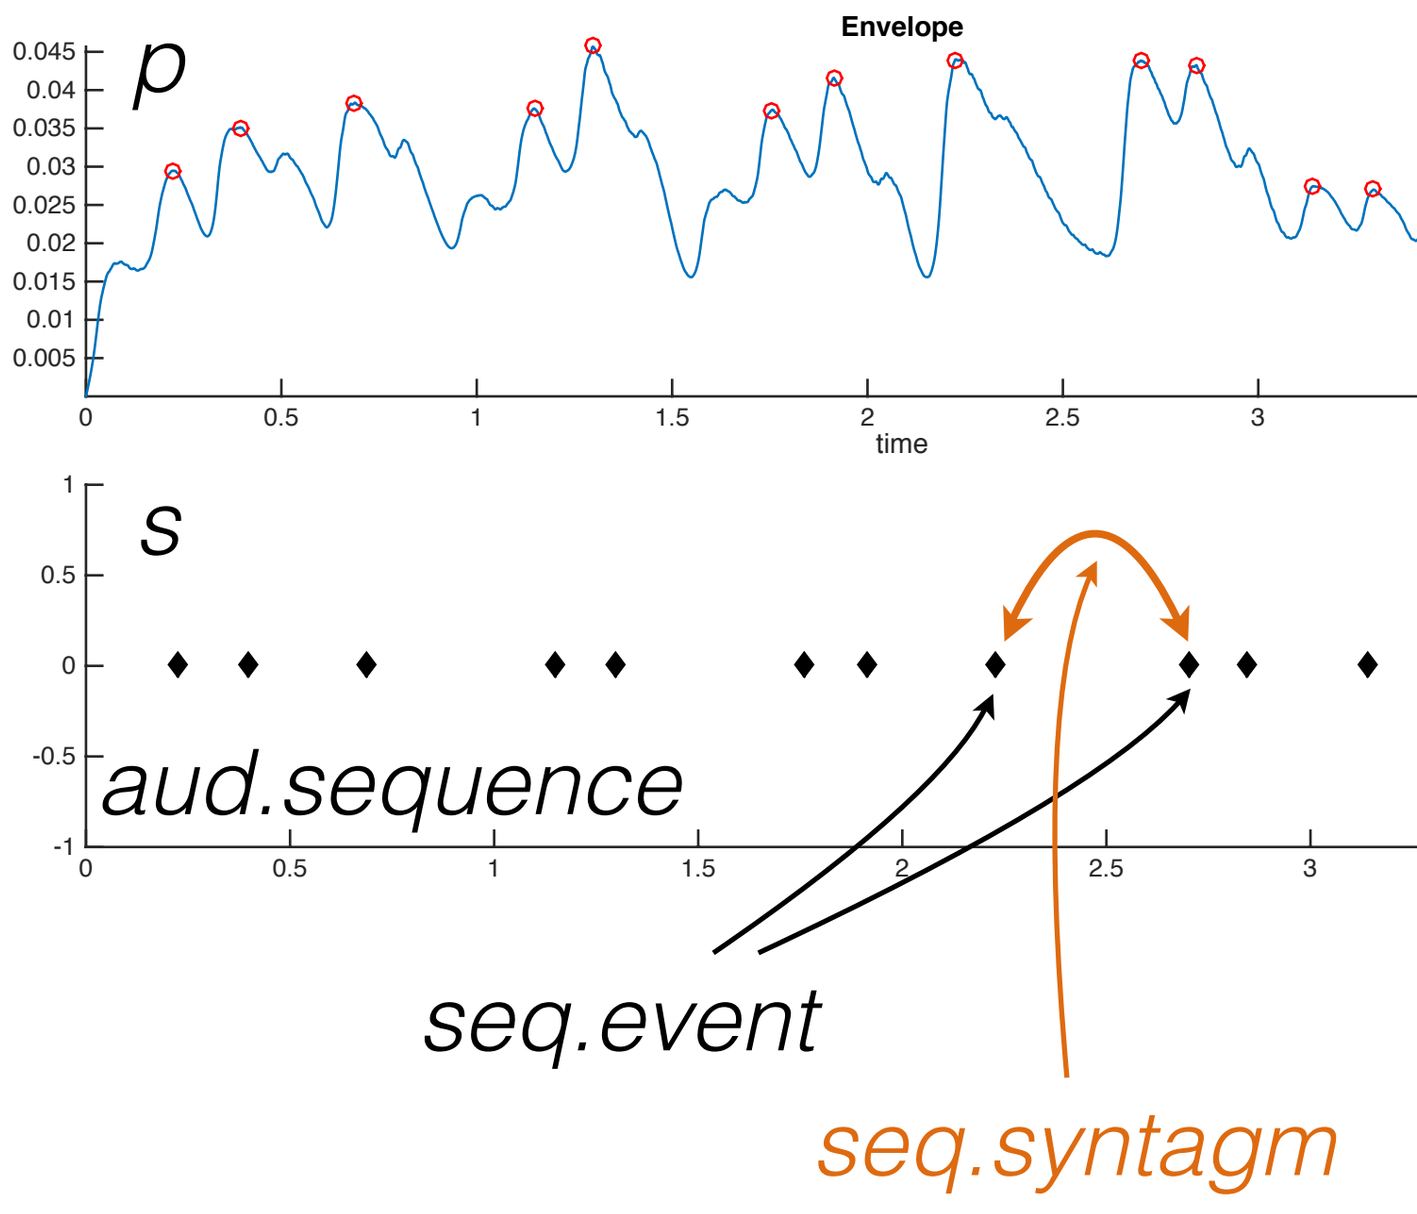
- *e = sig.envelope(‘myfile’)*
- *p = sig.peaks(e)*
- *s = sig.segment(‘myfile’, p)*

aud.score
onset detection

- *e = sig.envelope('myfile')*
- *p = sig.peaks(e, 'Contrast', .1)*
- *s = aud.score(p)*

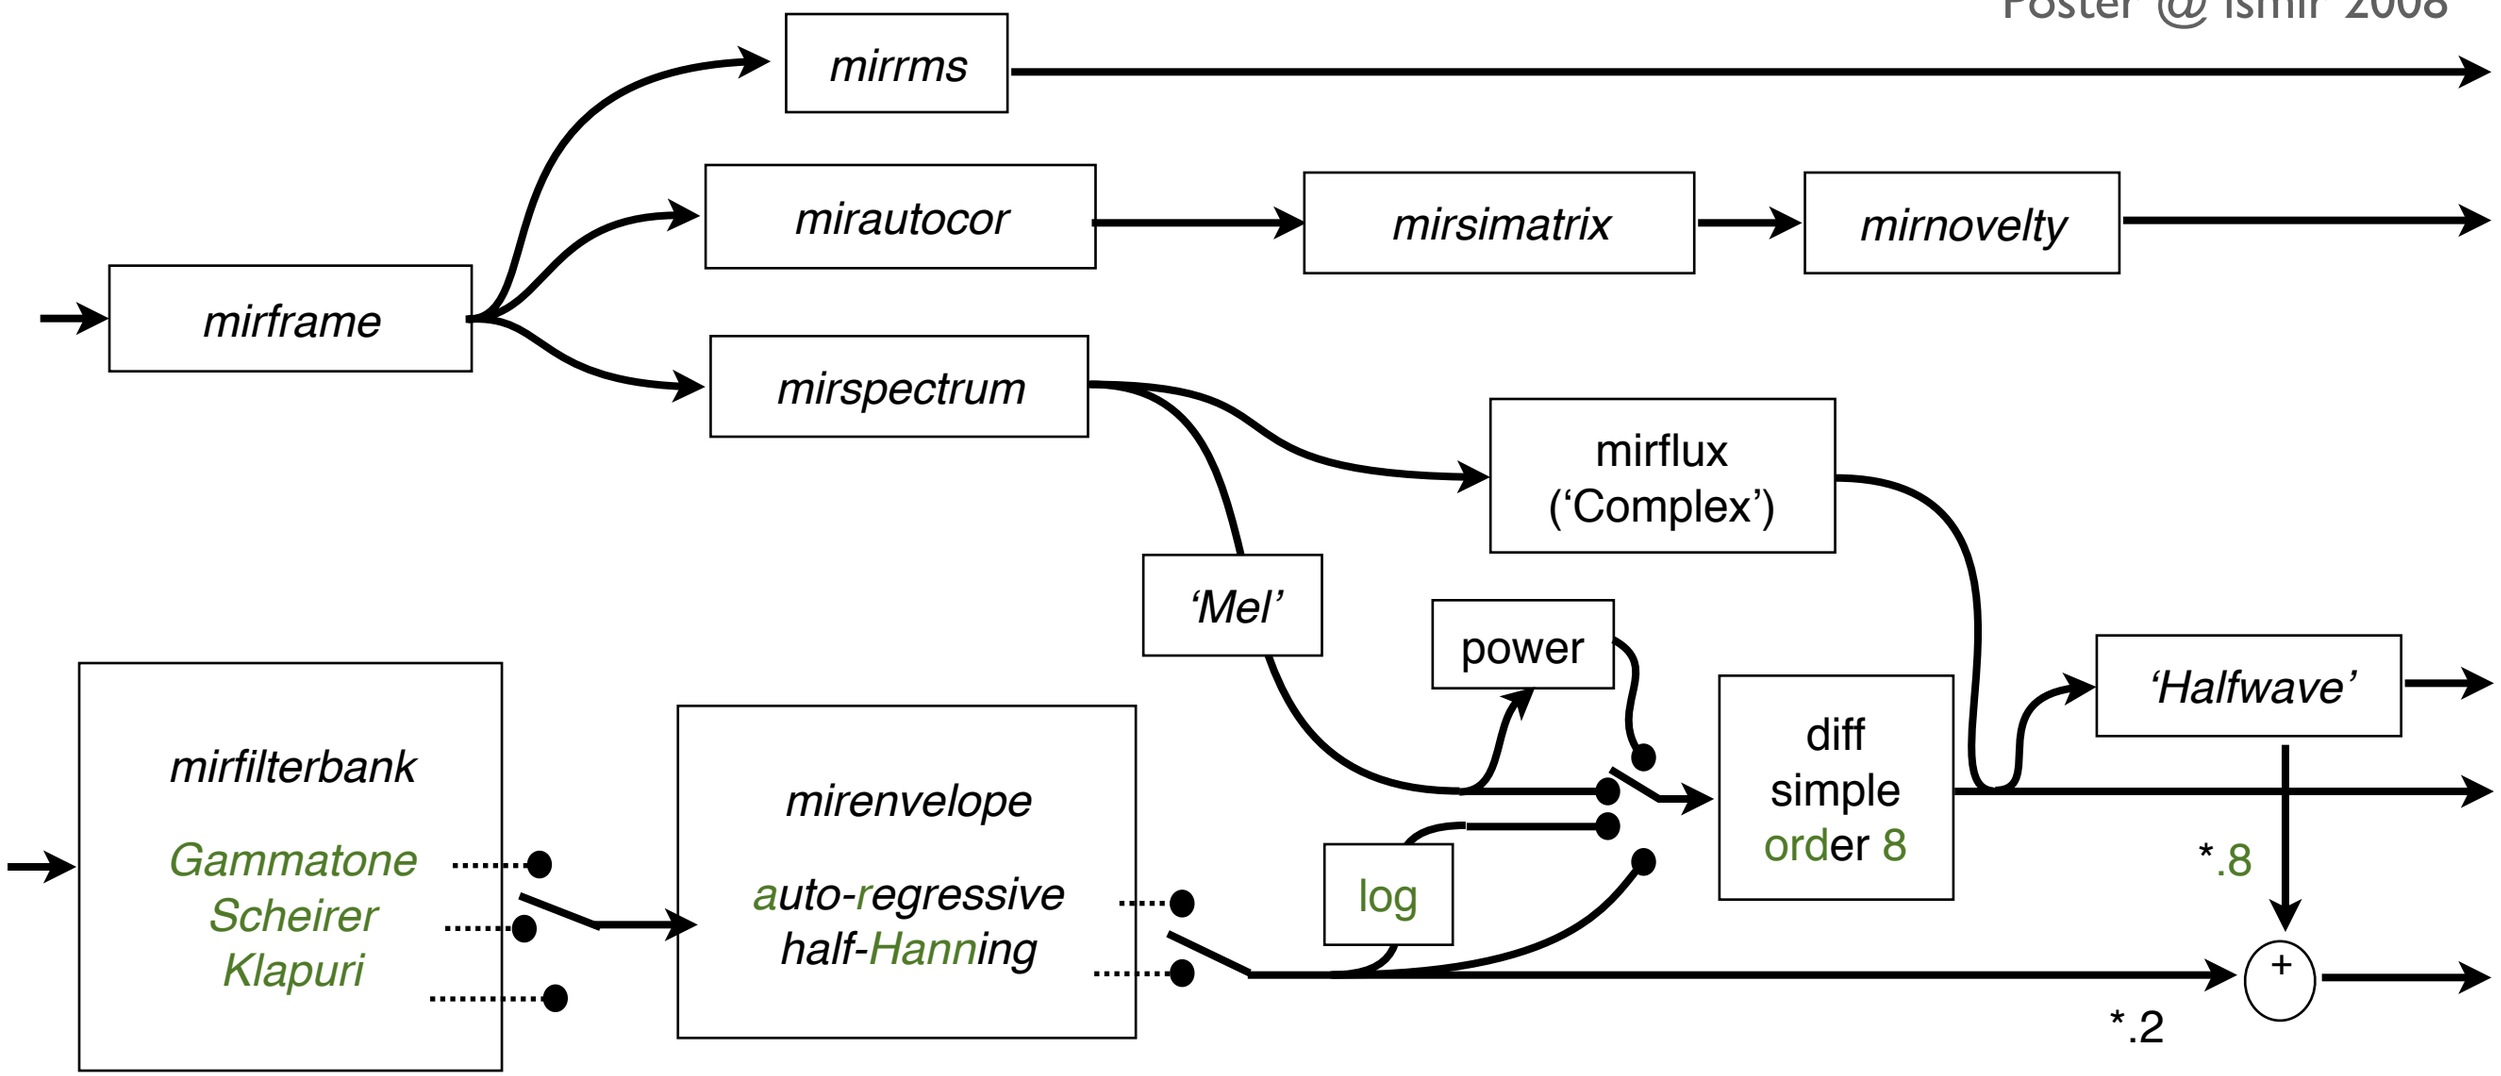
In short:

- *[s p] = aud.score('myfile', **Contrast**', .1)*



mironsets
onset detection

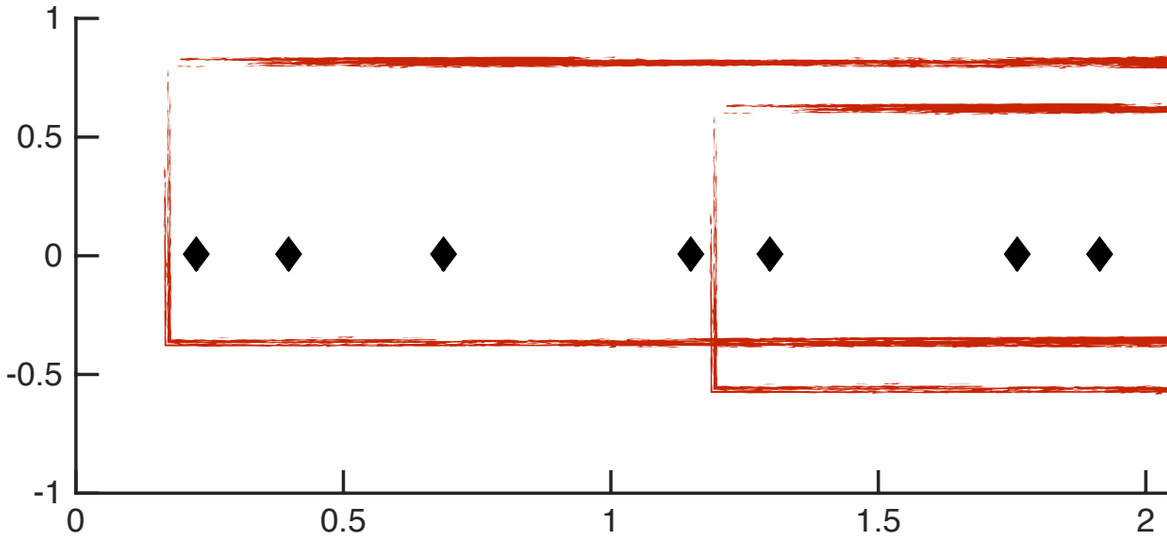
Poster @ ismir 2008

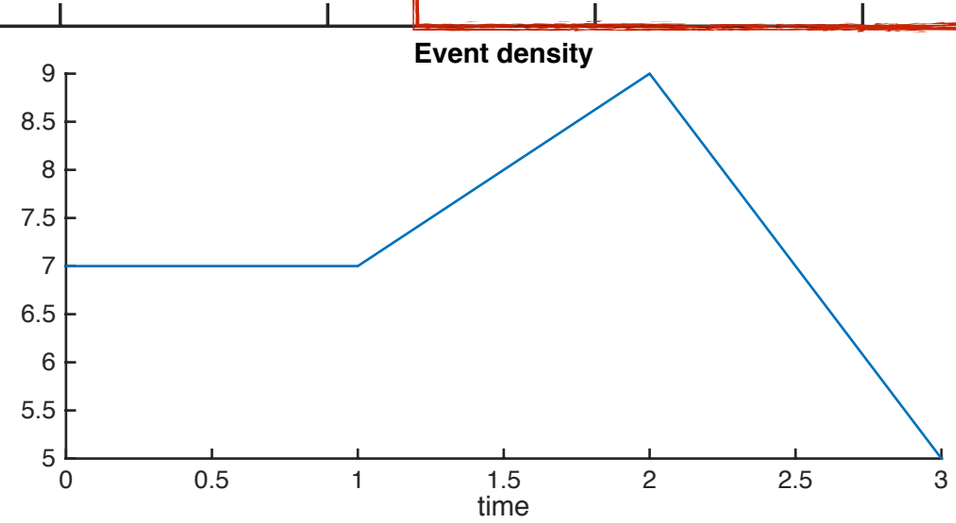


*aud.score(…, '**Scheirer**')*

*aud.score(…, '**Klapuri**')*

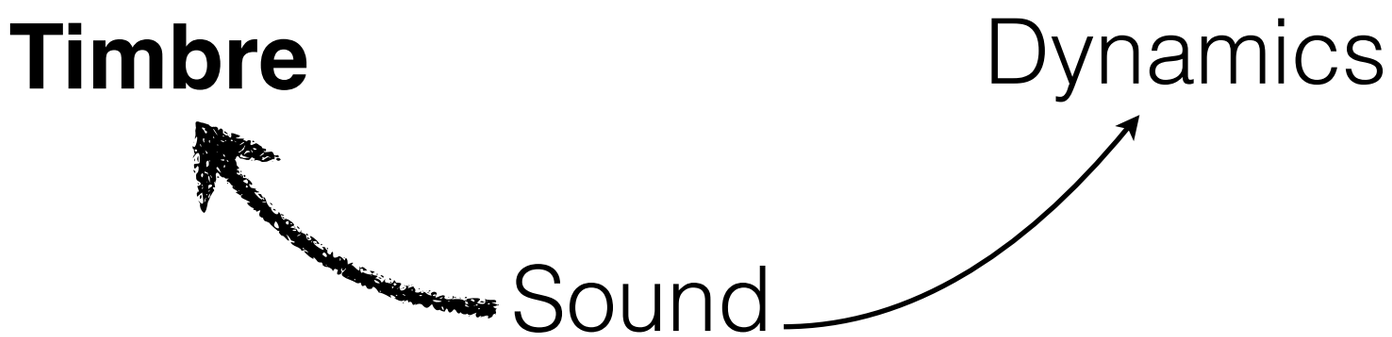
aud.eventdensity
temporal density of events



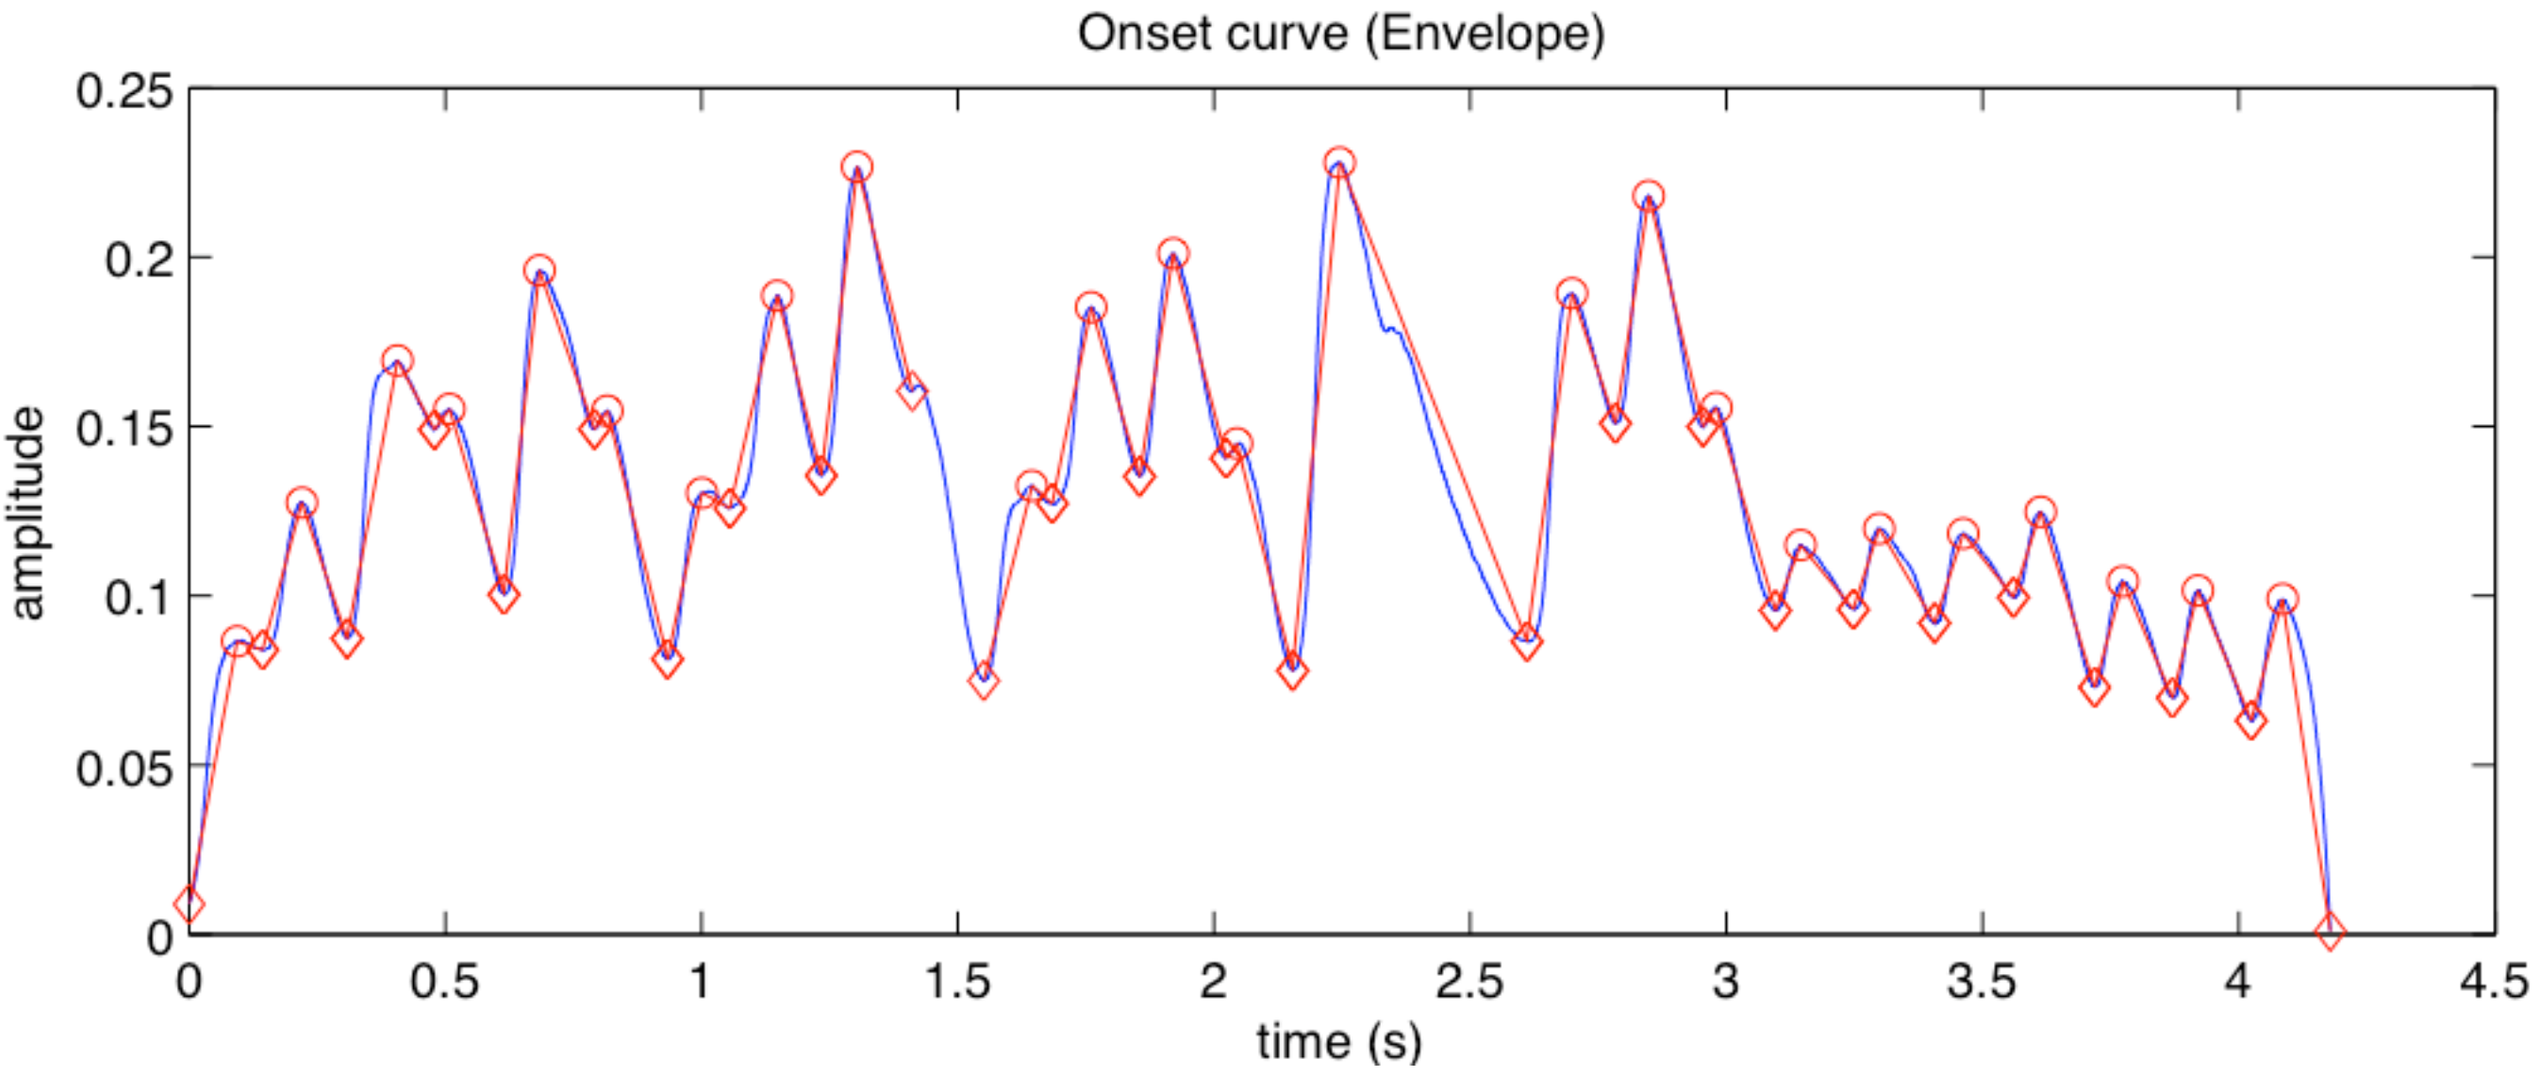


- a = aud.score('audio.wav')
- aud.eventdensity(a)
- aud.eventdensity('audio.wav', 'Frame')
- aud.eventdensity('score.mid')

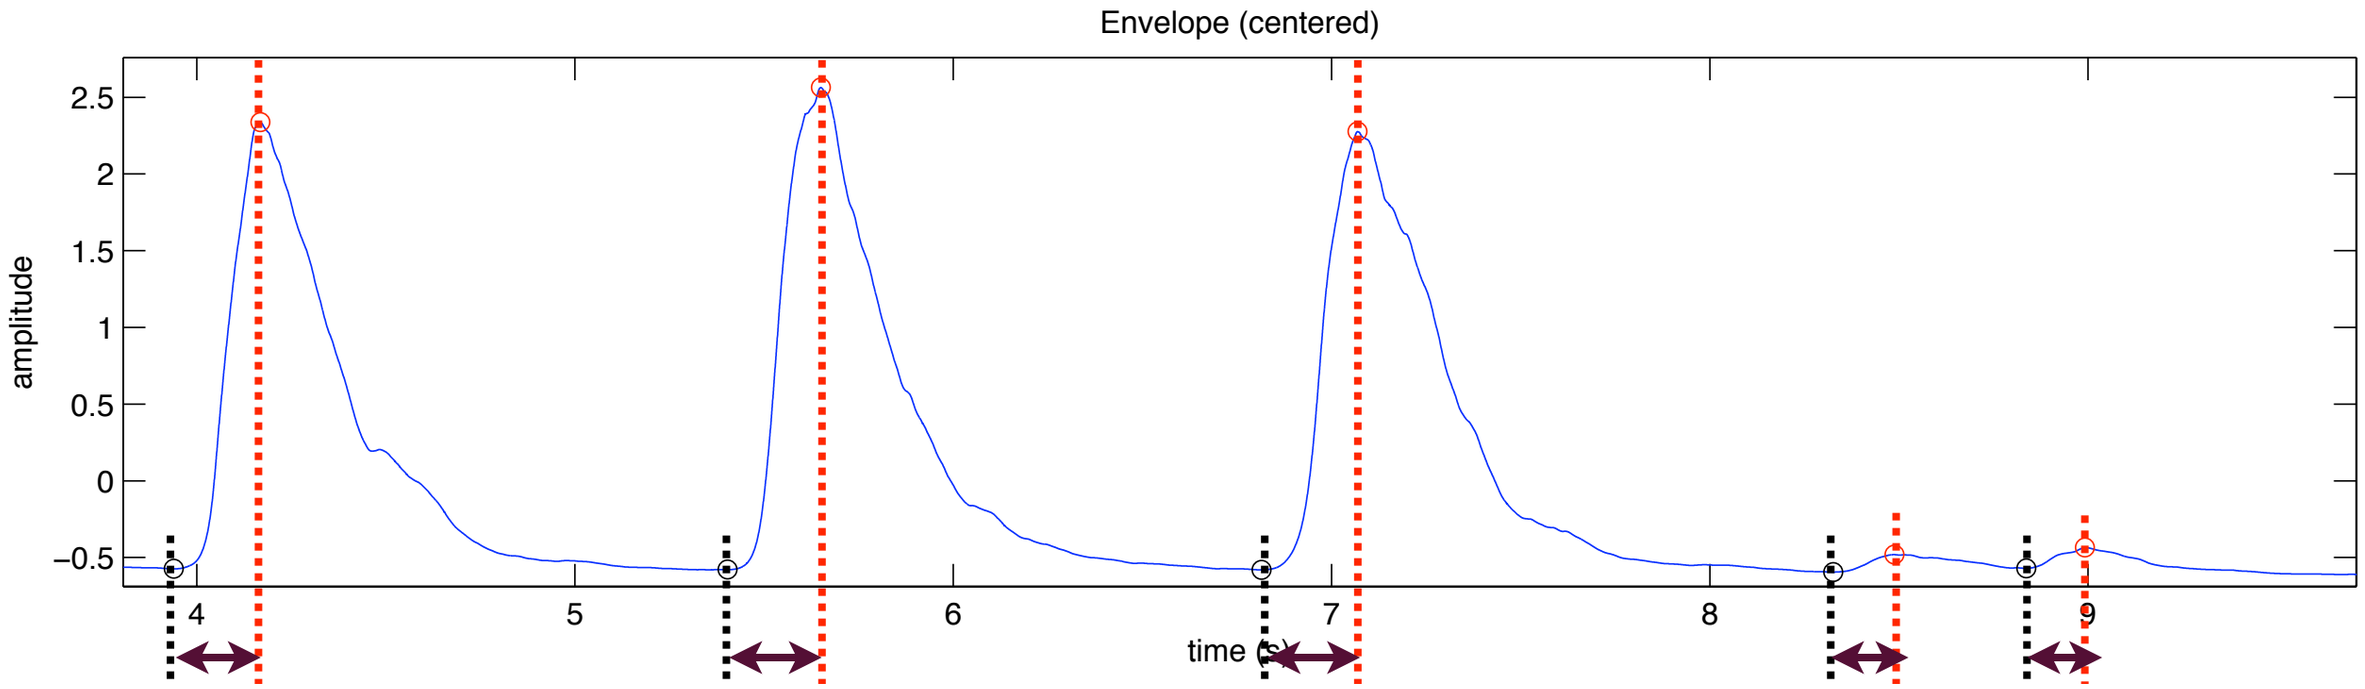
Audio level



aud.score(…, ‘Attack’, ‘Release’)



aud.attacktime
duration of note attacks



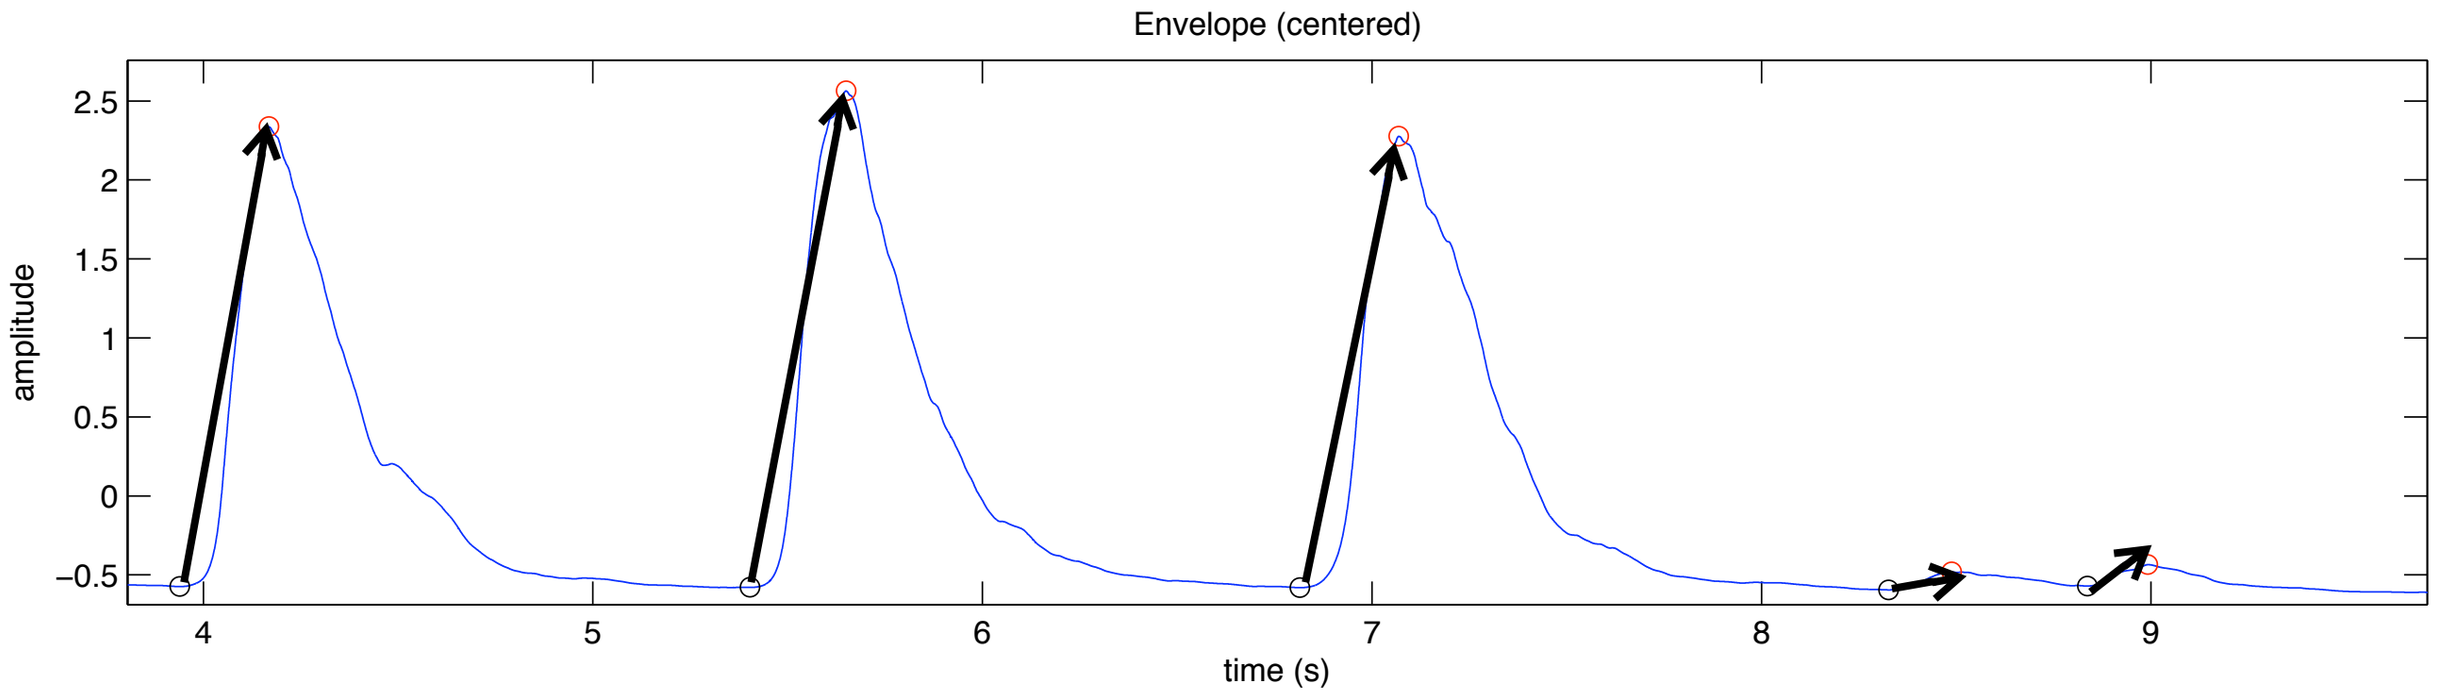
- *aud.attacktime(…, '**Lin**')*: duration in seconds

- *aud.attacktime(…, '**Log**')*: duration in log scale

Krimphoff, J., McAdams, S. & Winsberg, S. (1994), Caractérisation du timbre des sons complexes. II : Analyses acoustiques et quantification psychophysique. Journal de Physique, 4(C5), 625-628.

aud.attackslope

average slope of note attacks

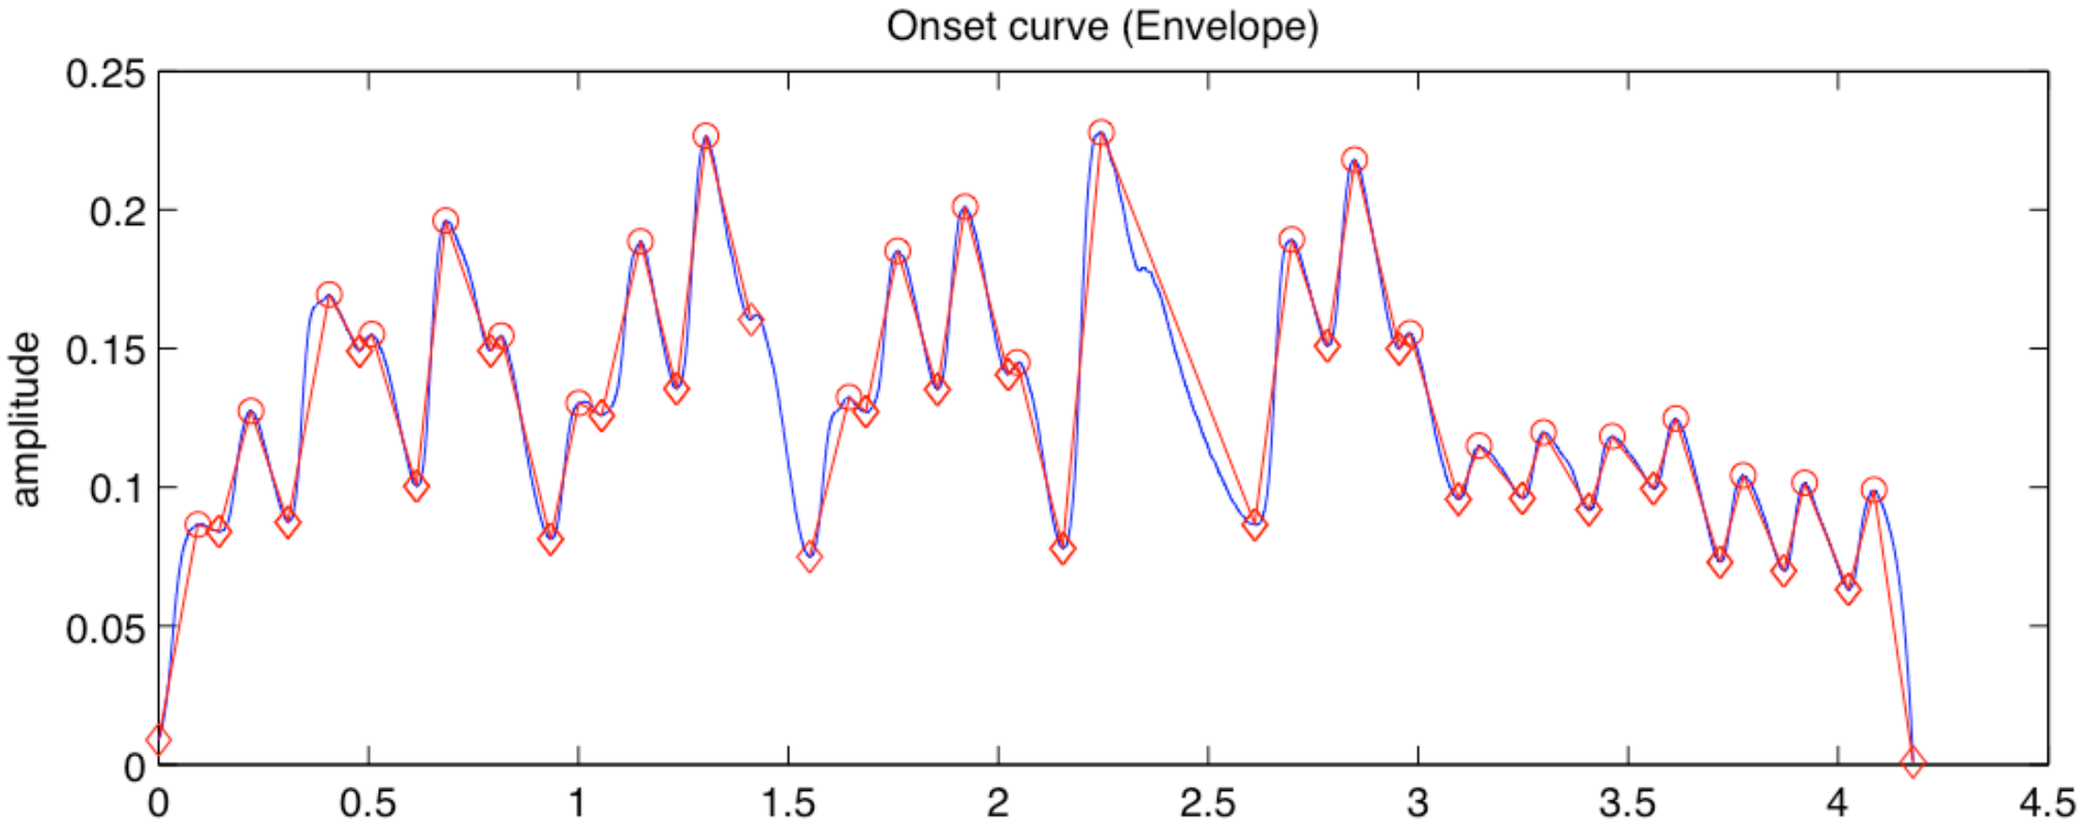


- *mirattackslope(..., '**Diff**')*: average slope

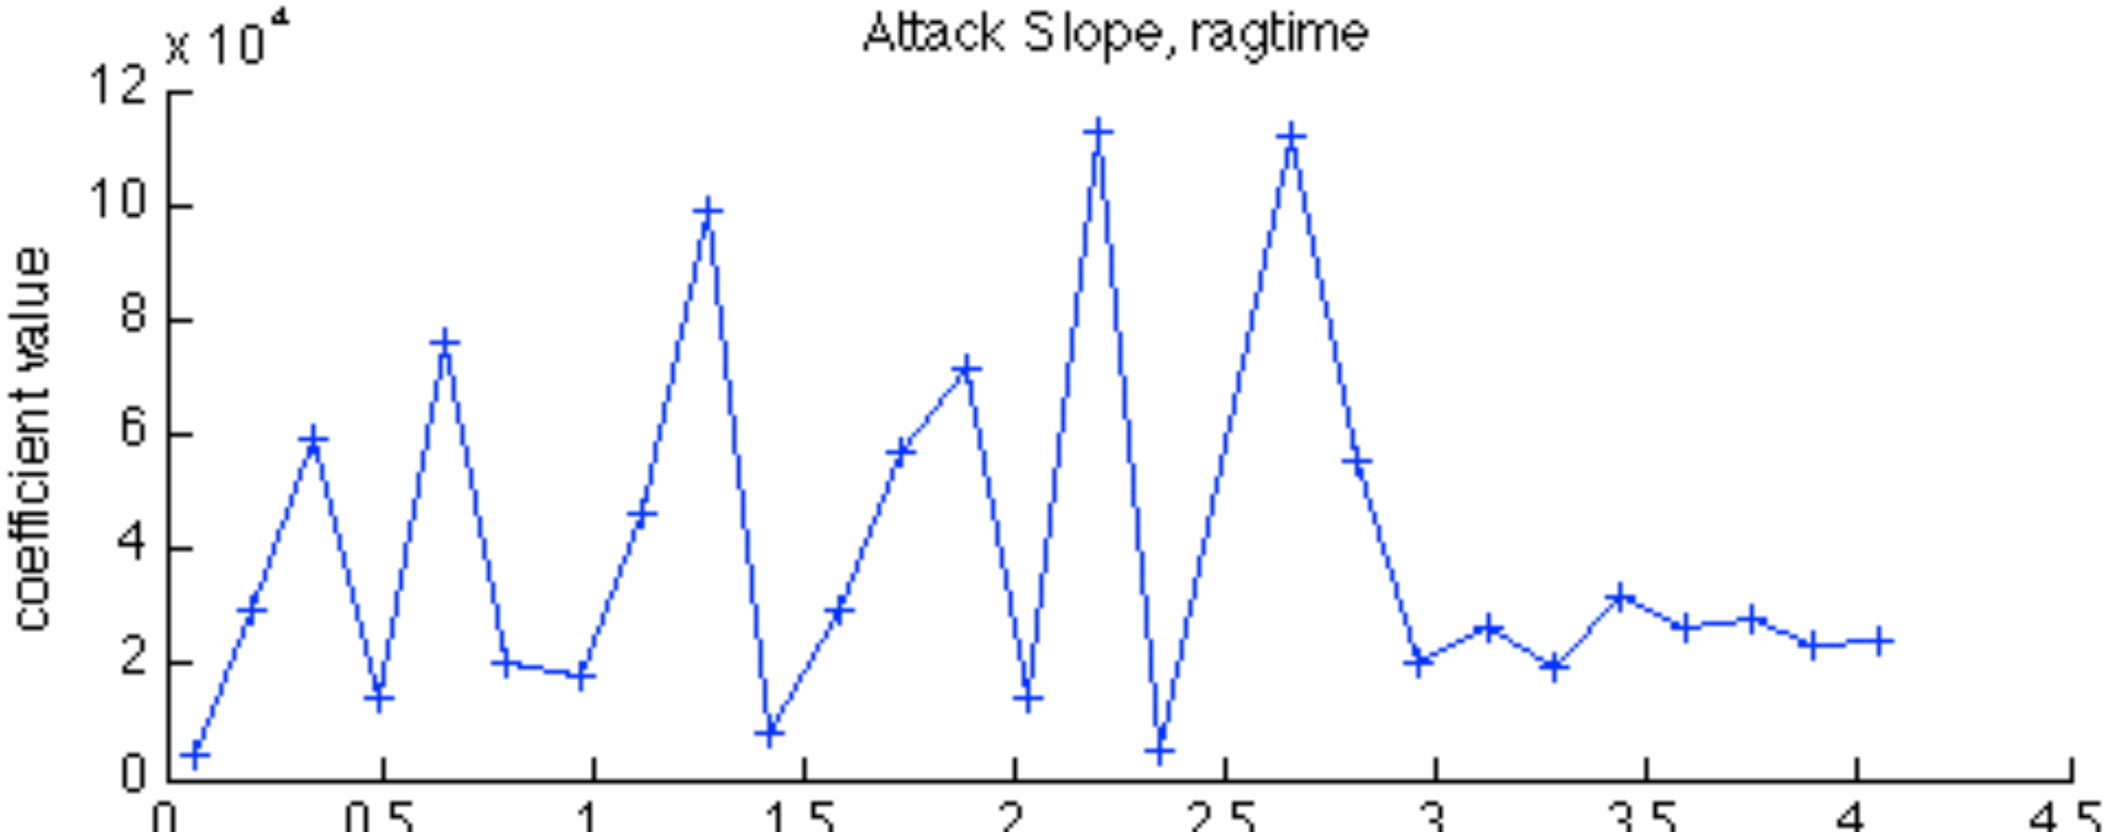
- *mirattackslope(..., '**Gauss**')*: gaussian average, highlighting the middle of the attack phase

Peeters. G. (2004). A large set of audio features for sound description (similarity and classification) in the CUIDADO project. version 1.0

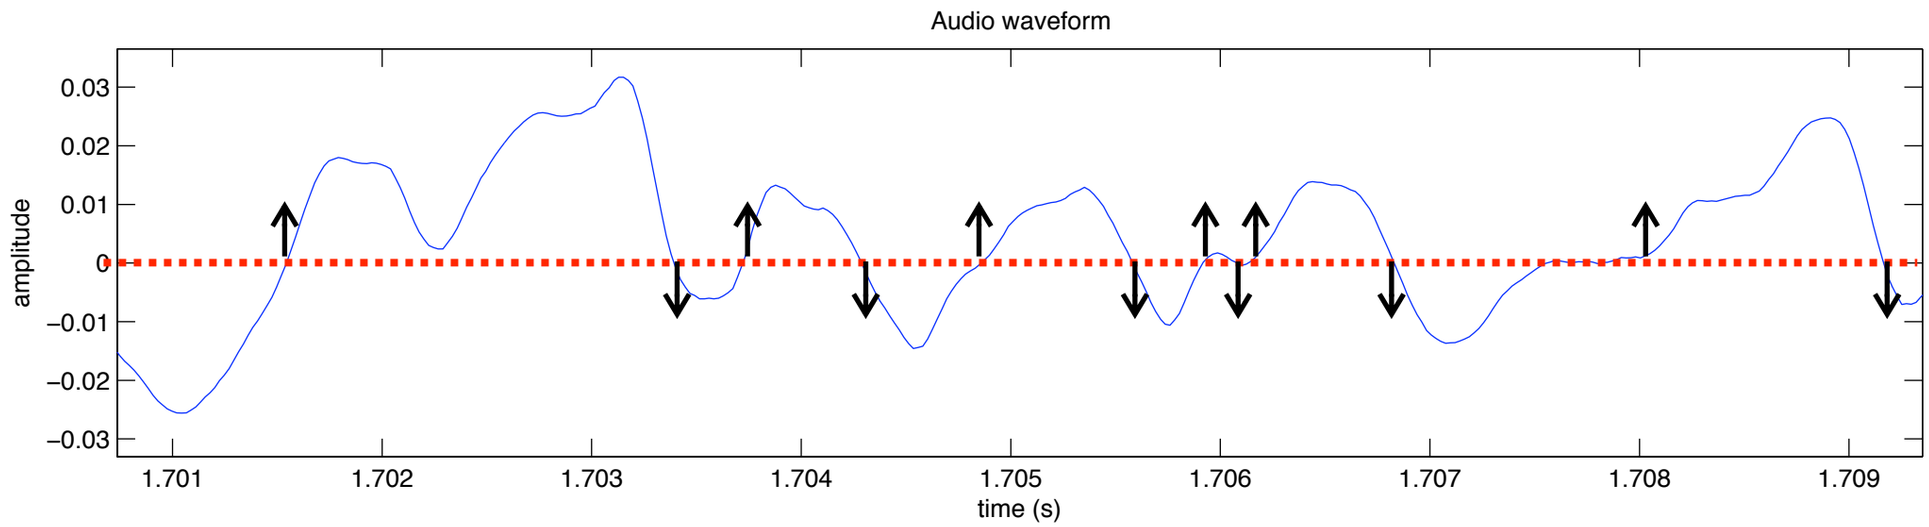
- *o = aud.onsets('audiofile', 'Attack', 'Release')*



- *aud.attackslope(o)*

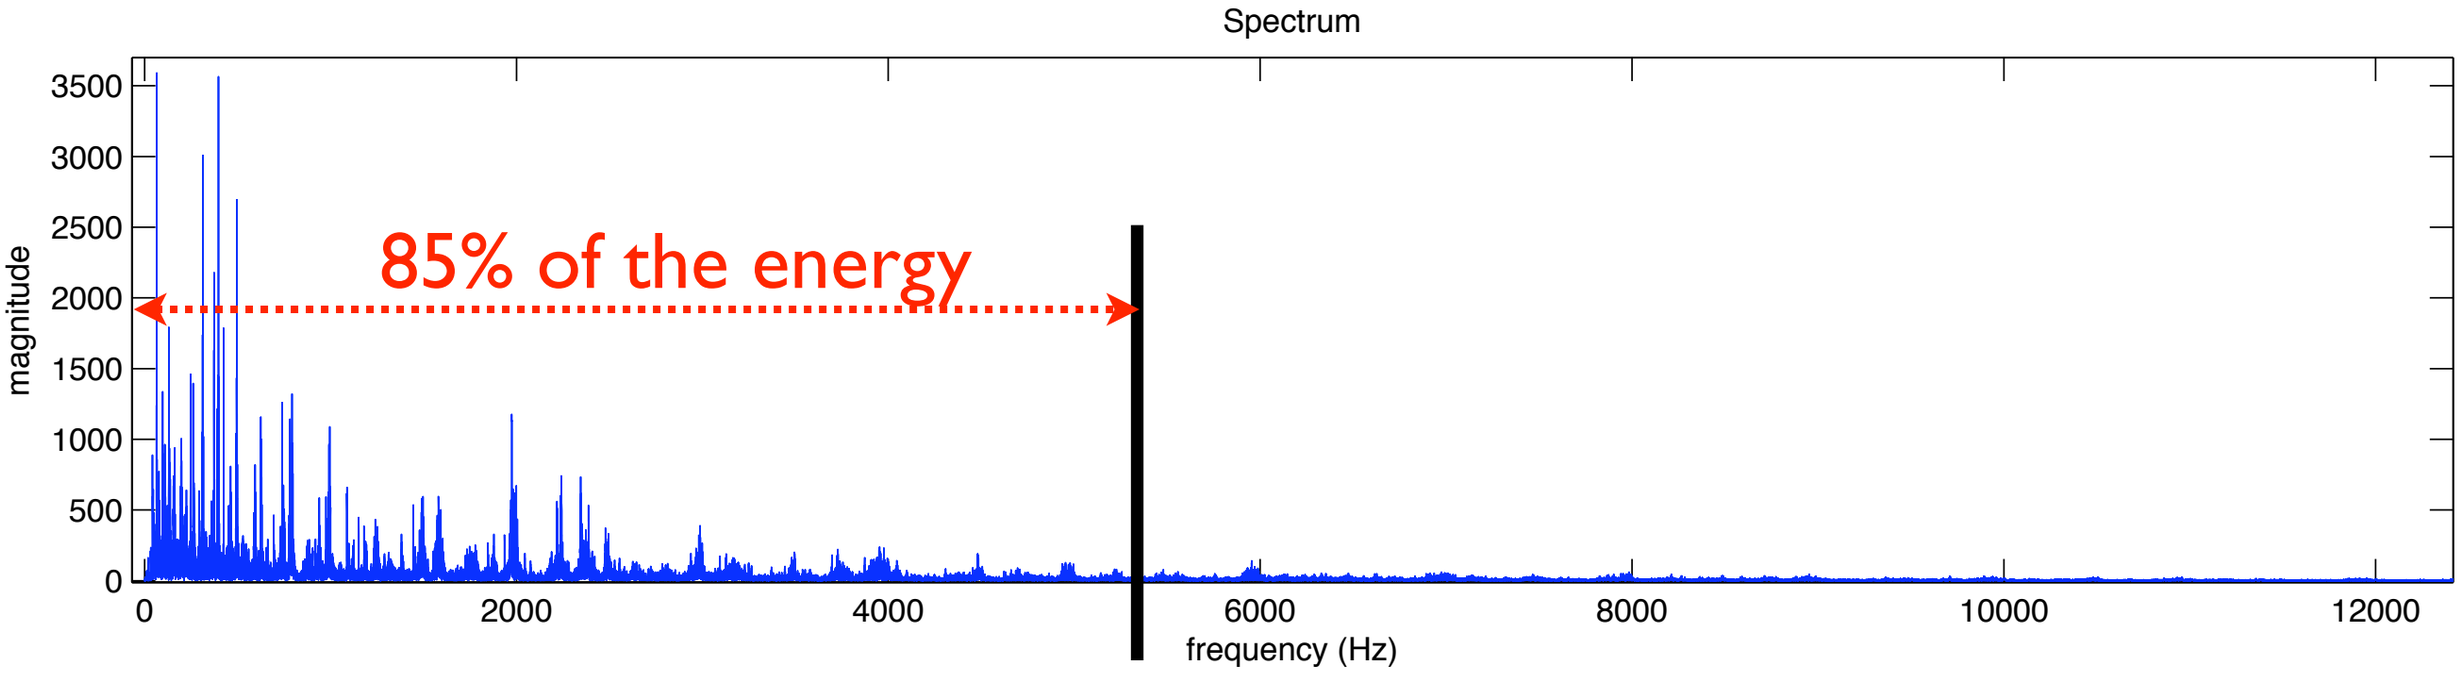


sig.zerocross
waveform sign-change rate



- Indicator of nosiness
- sig.zerocross(…, ‘**Per**’, ‘**Second**’): rate per second
- sig.zerocross(..., ‘Per’, ‘**Sample**’): rate per sample
- sig.zerocross(..., ‘**Dir**’, ‘**One**’): only ↑ or ↓
- sig.zerocross(..., ‘Dir’, ‘**Both**’): both ↑ and ↓

sig.rolloff
high-frequency energy (I)



5640.53 Hz

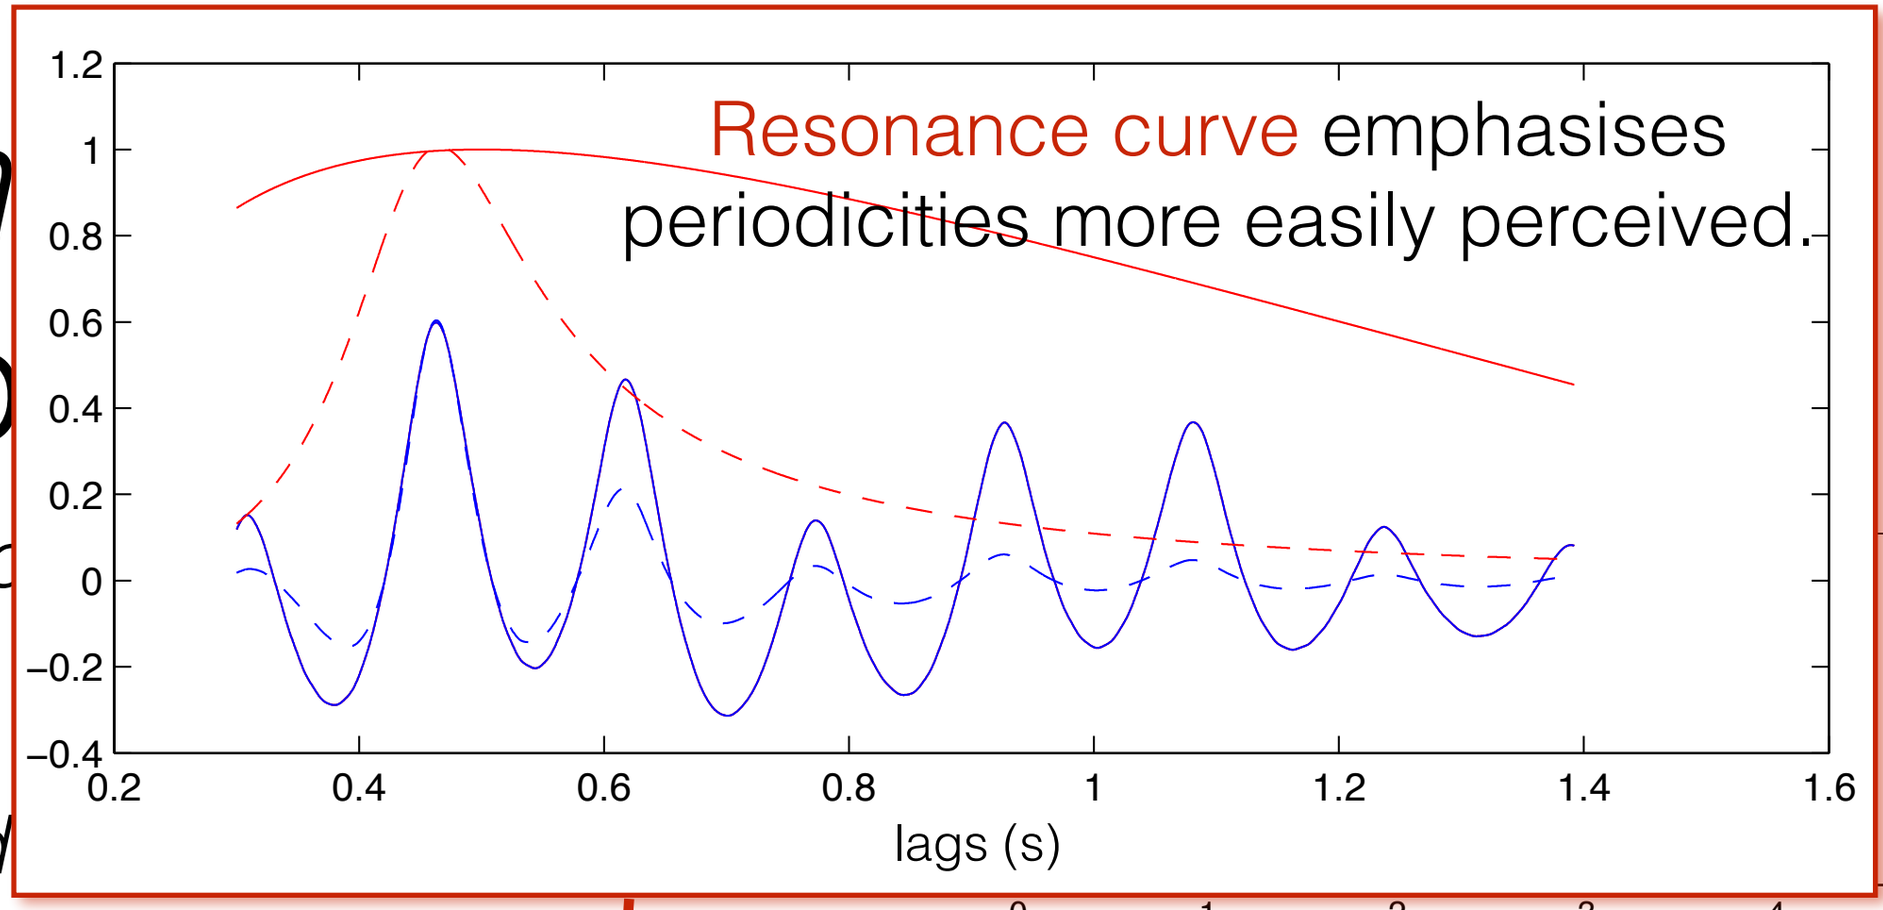
- *do = aud*



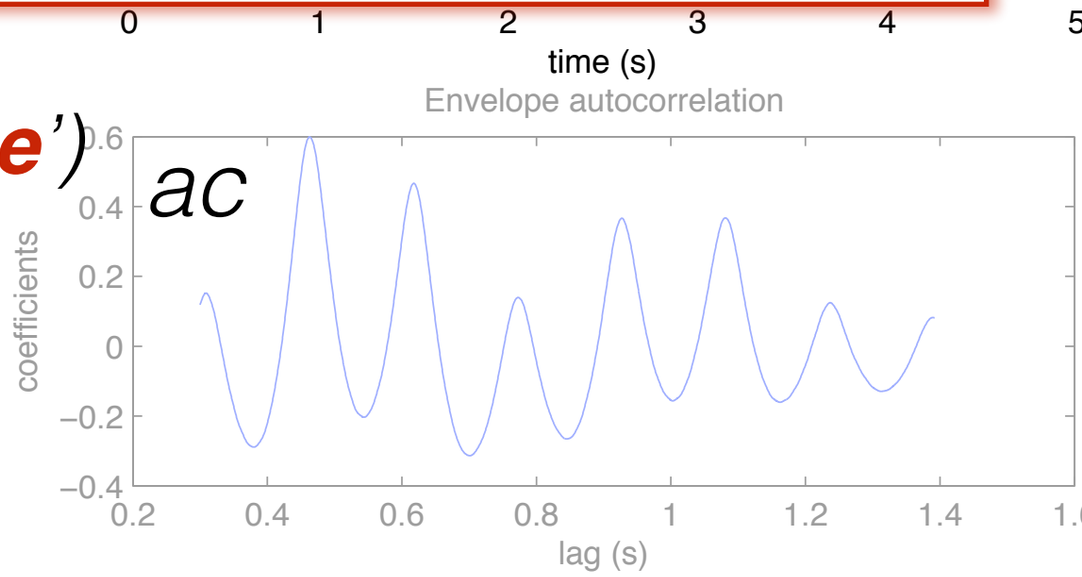
- *ac = **aud**.autocor(do, '**Resonance**')*

- *pa = sig.peaks(ac, 'Total', 1)*

In short:

- *[t, pa] = mus.tempo('mysong')*

t = 129.6333 bpm



mus.tempo
tempo estimation

- *o = aud.onsets('mysong', 'Detect', 'No')*

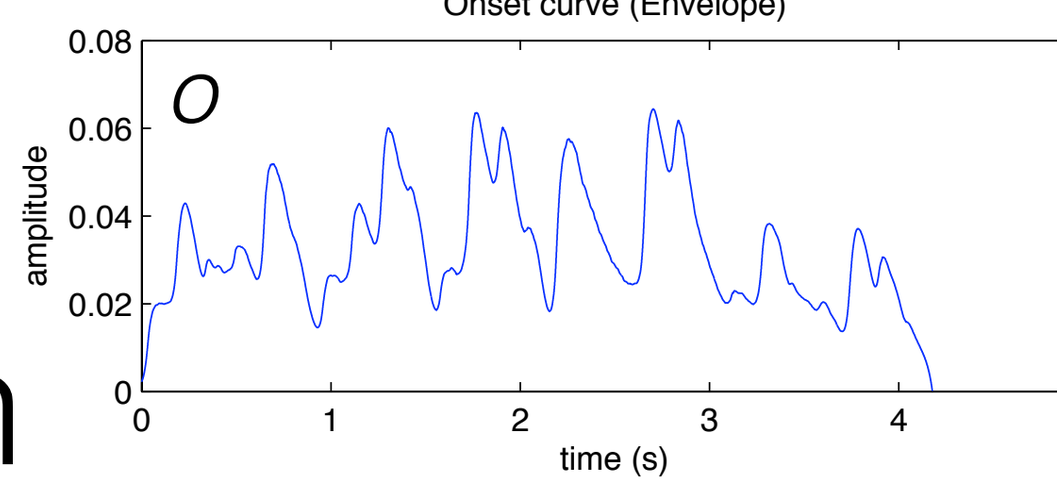
- *do = aud.onsets(o, 'Diff')*

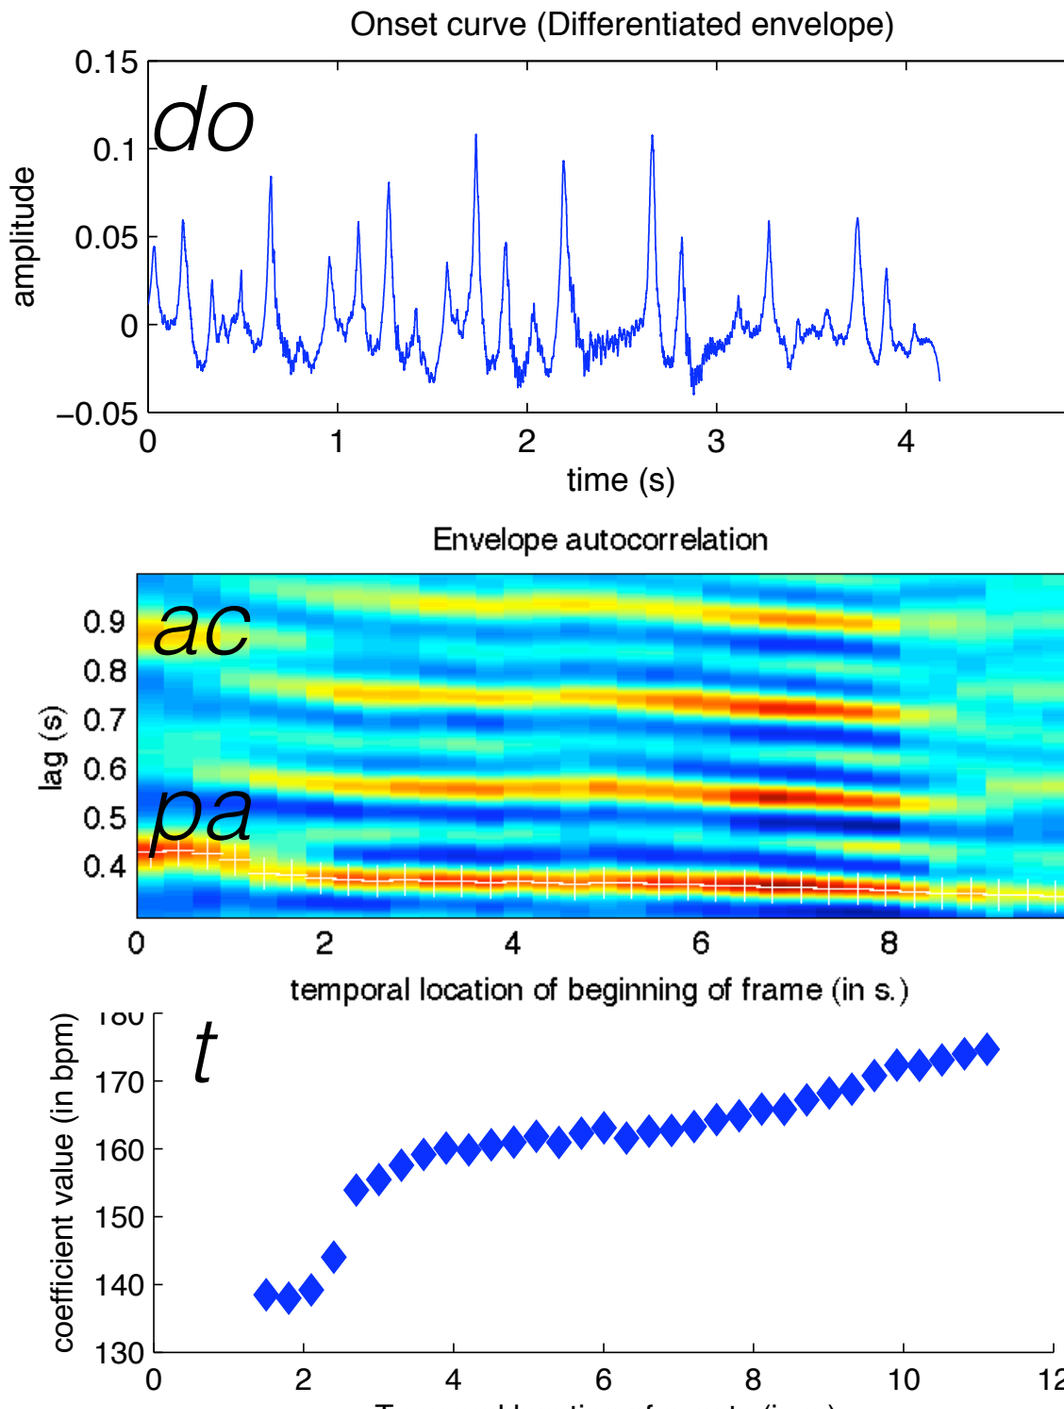
- *ac = aud.autocor(do, '**Frame**', 'Resonance')*

- *pa = sig.peaks(ac, 'Total', 1)*

In short:

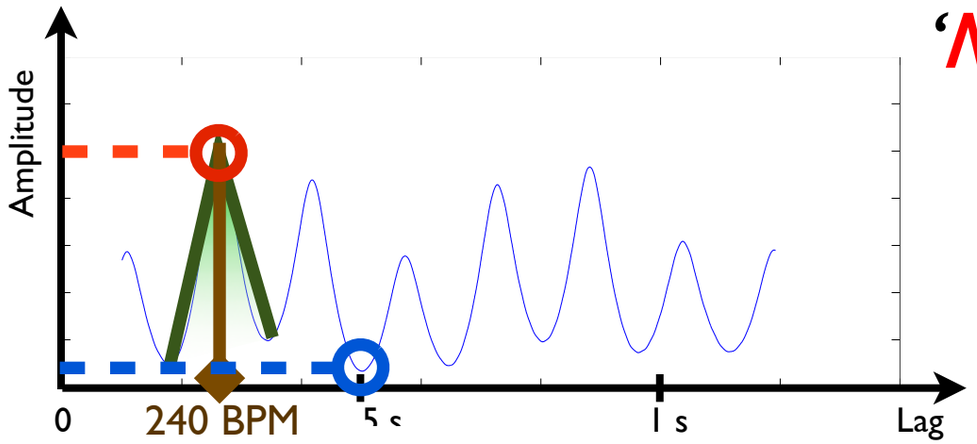
- *[t, pa] = mus.tempo('mysong', '**Frame**')*





mus.pulseclarity
rhythmic clarity, beat strength

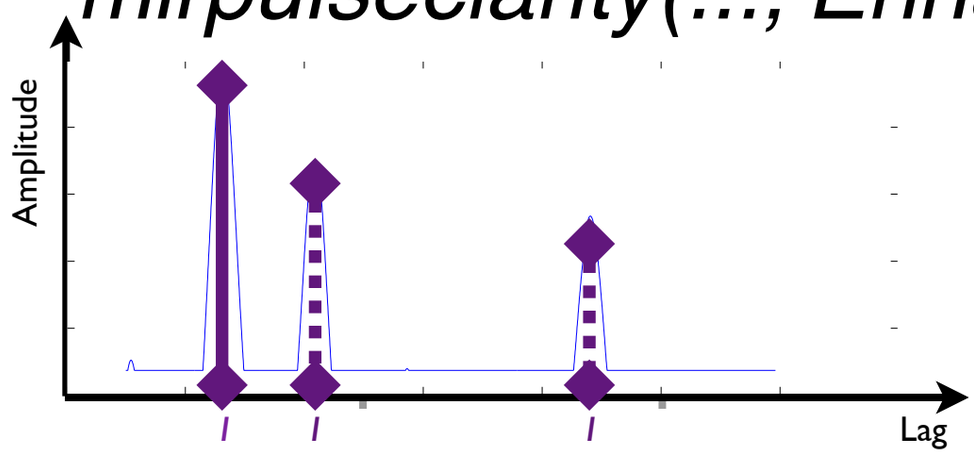
mirpulseclarity(...,'Enhanced', 'No')



'*MaxAutocor*' '*MinAutocor*'
'*KurtosisAutocor*'
'*TempoAutocor*'
'*EntropyAutocor*'
'*InterfAutocor*'

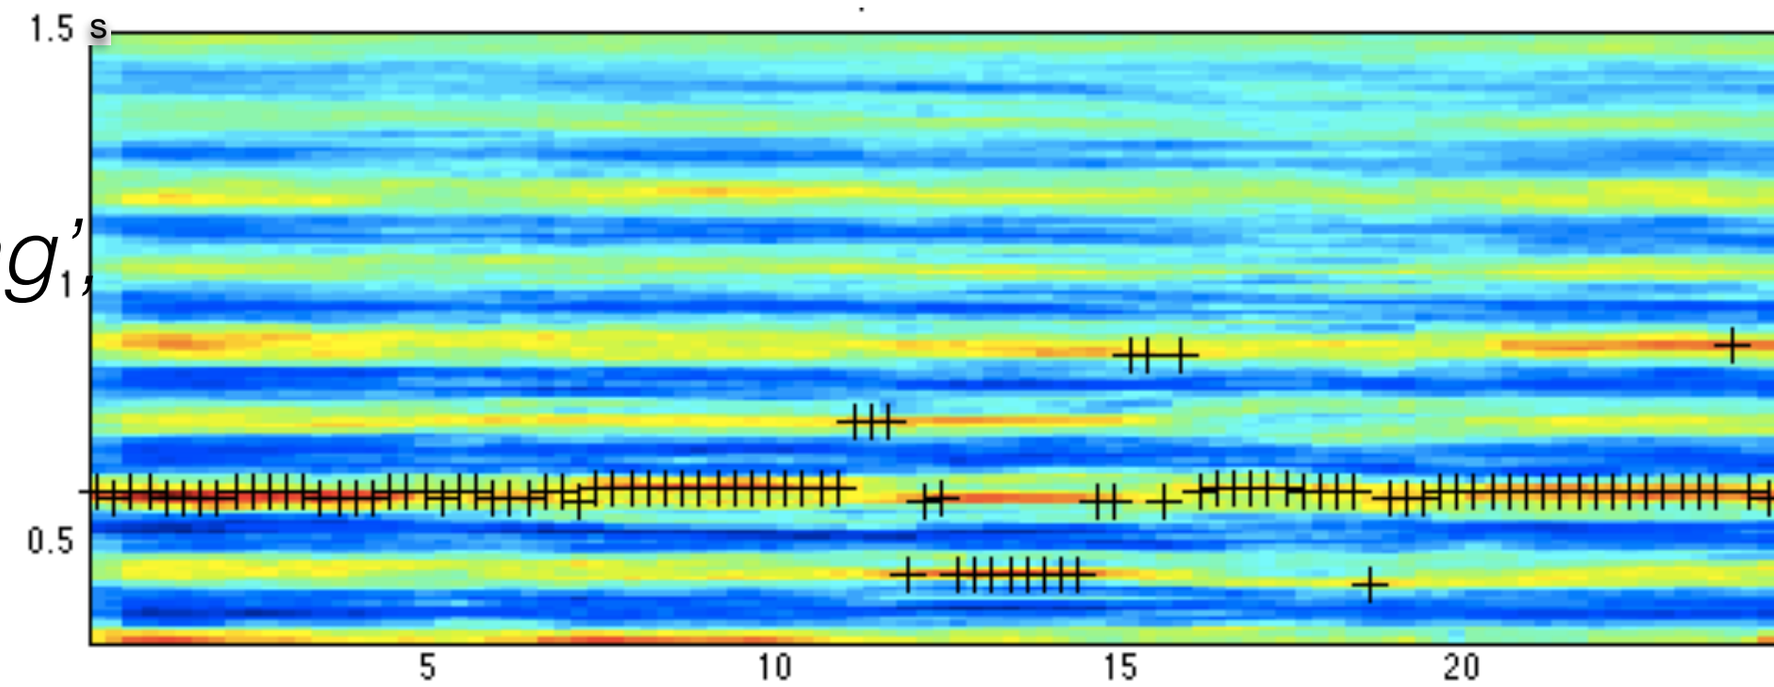
0

mirpulseclarity(...,'Enhanced', 'Yes')



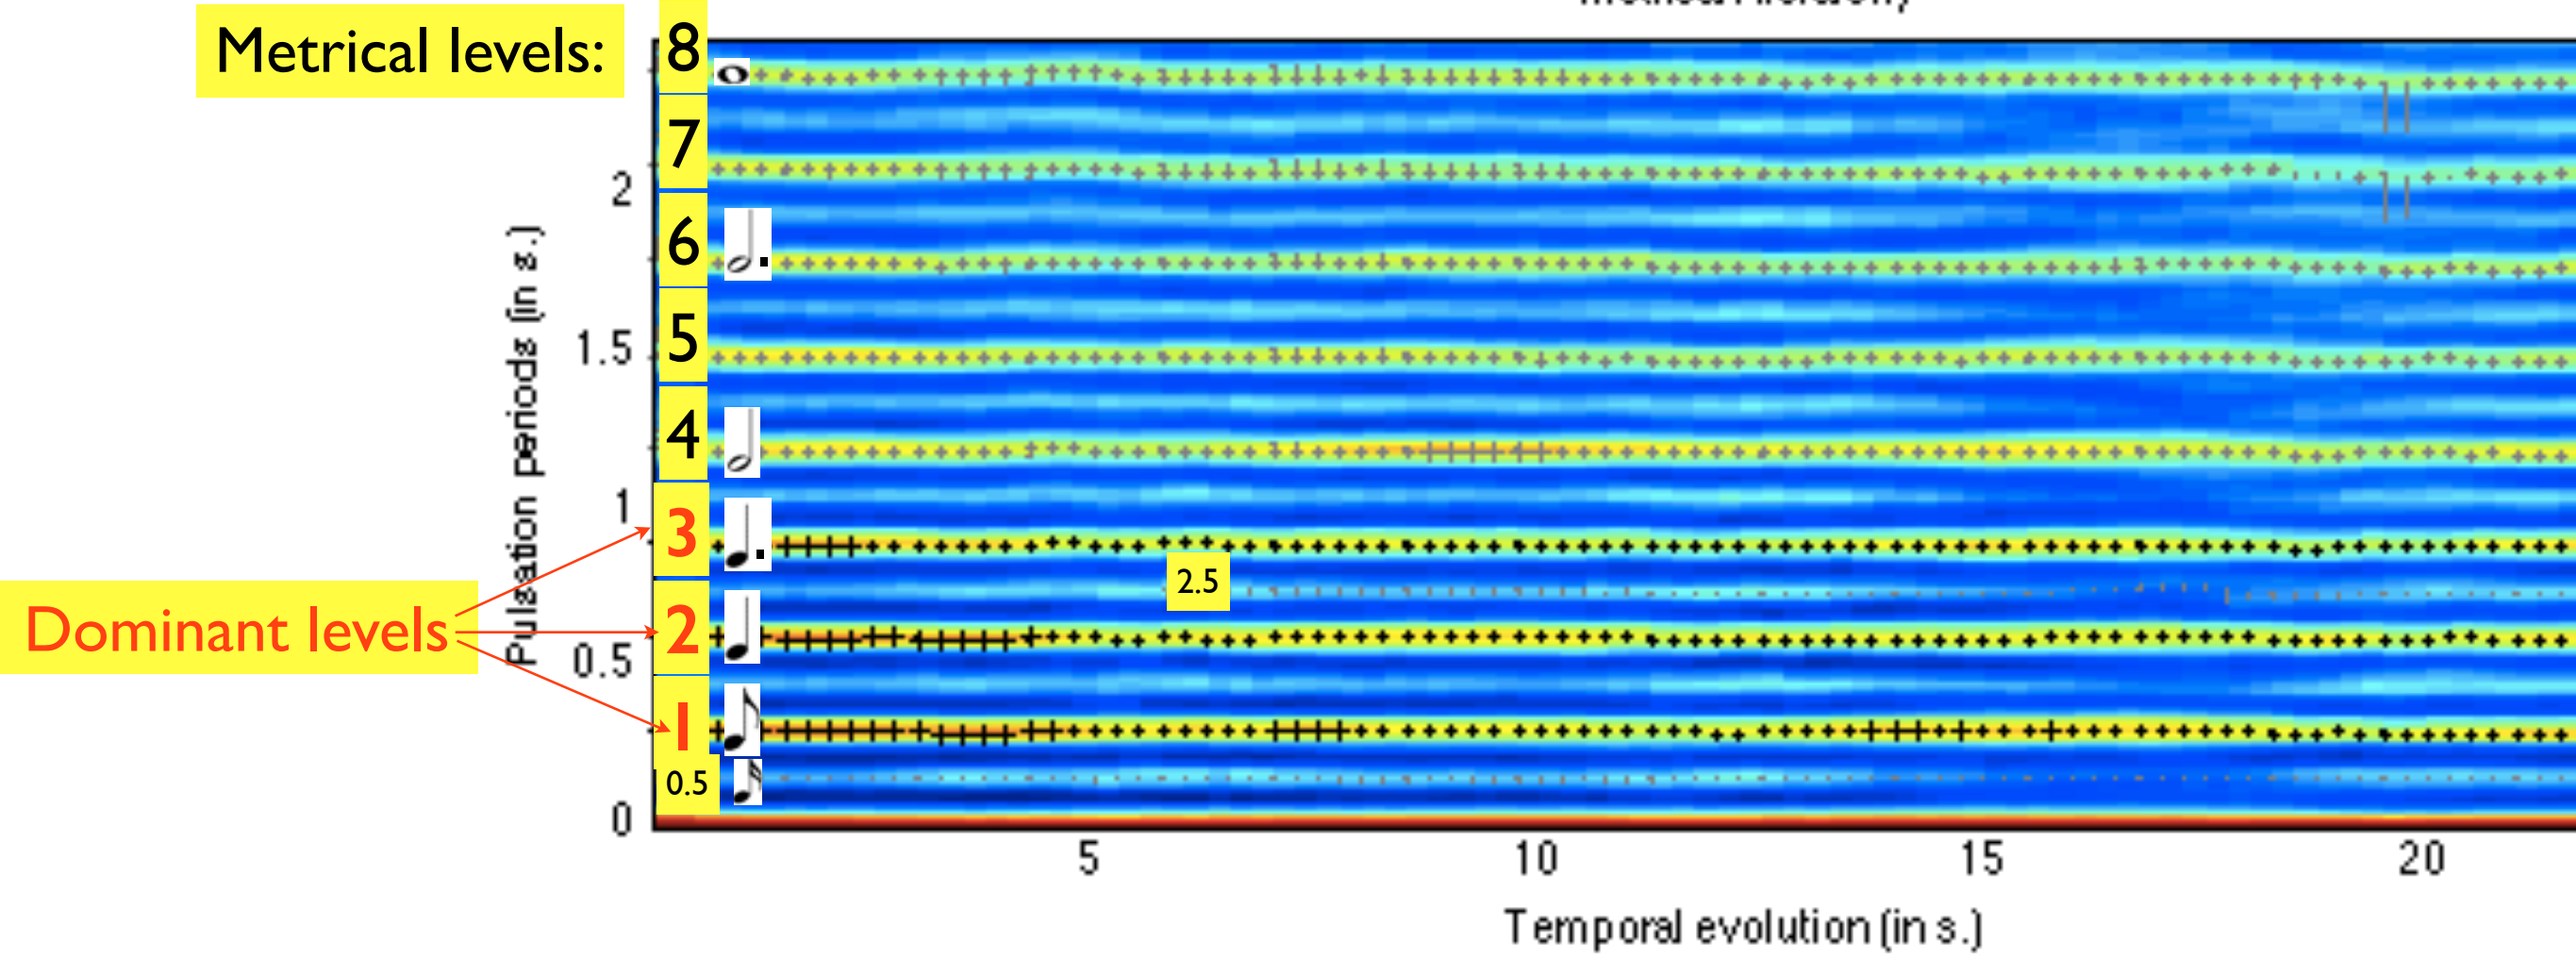
'*EntropyAutocor*'
'*InterfAutocor*'

*[t, pa] = mus.tempo('mysong', '**Frame**')*



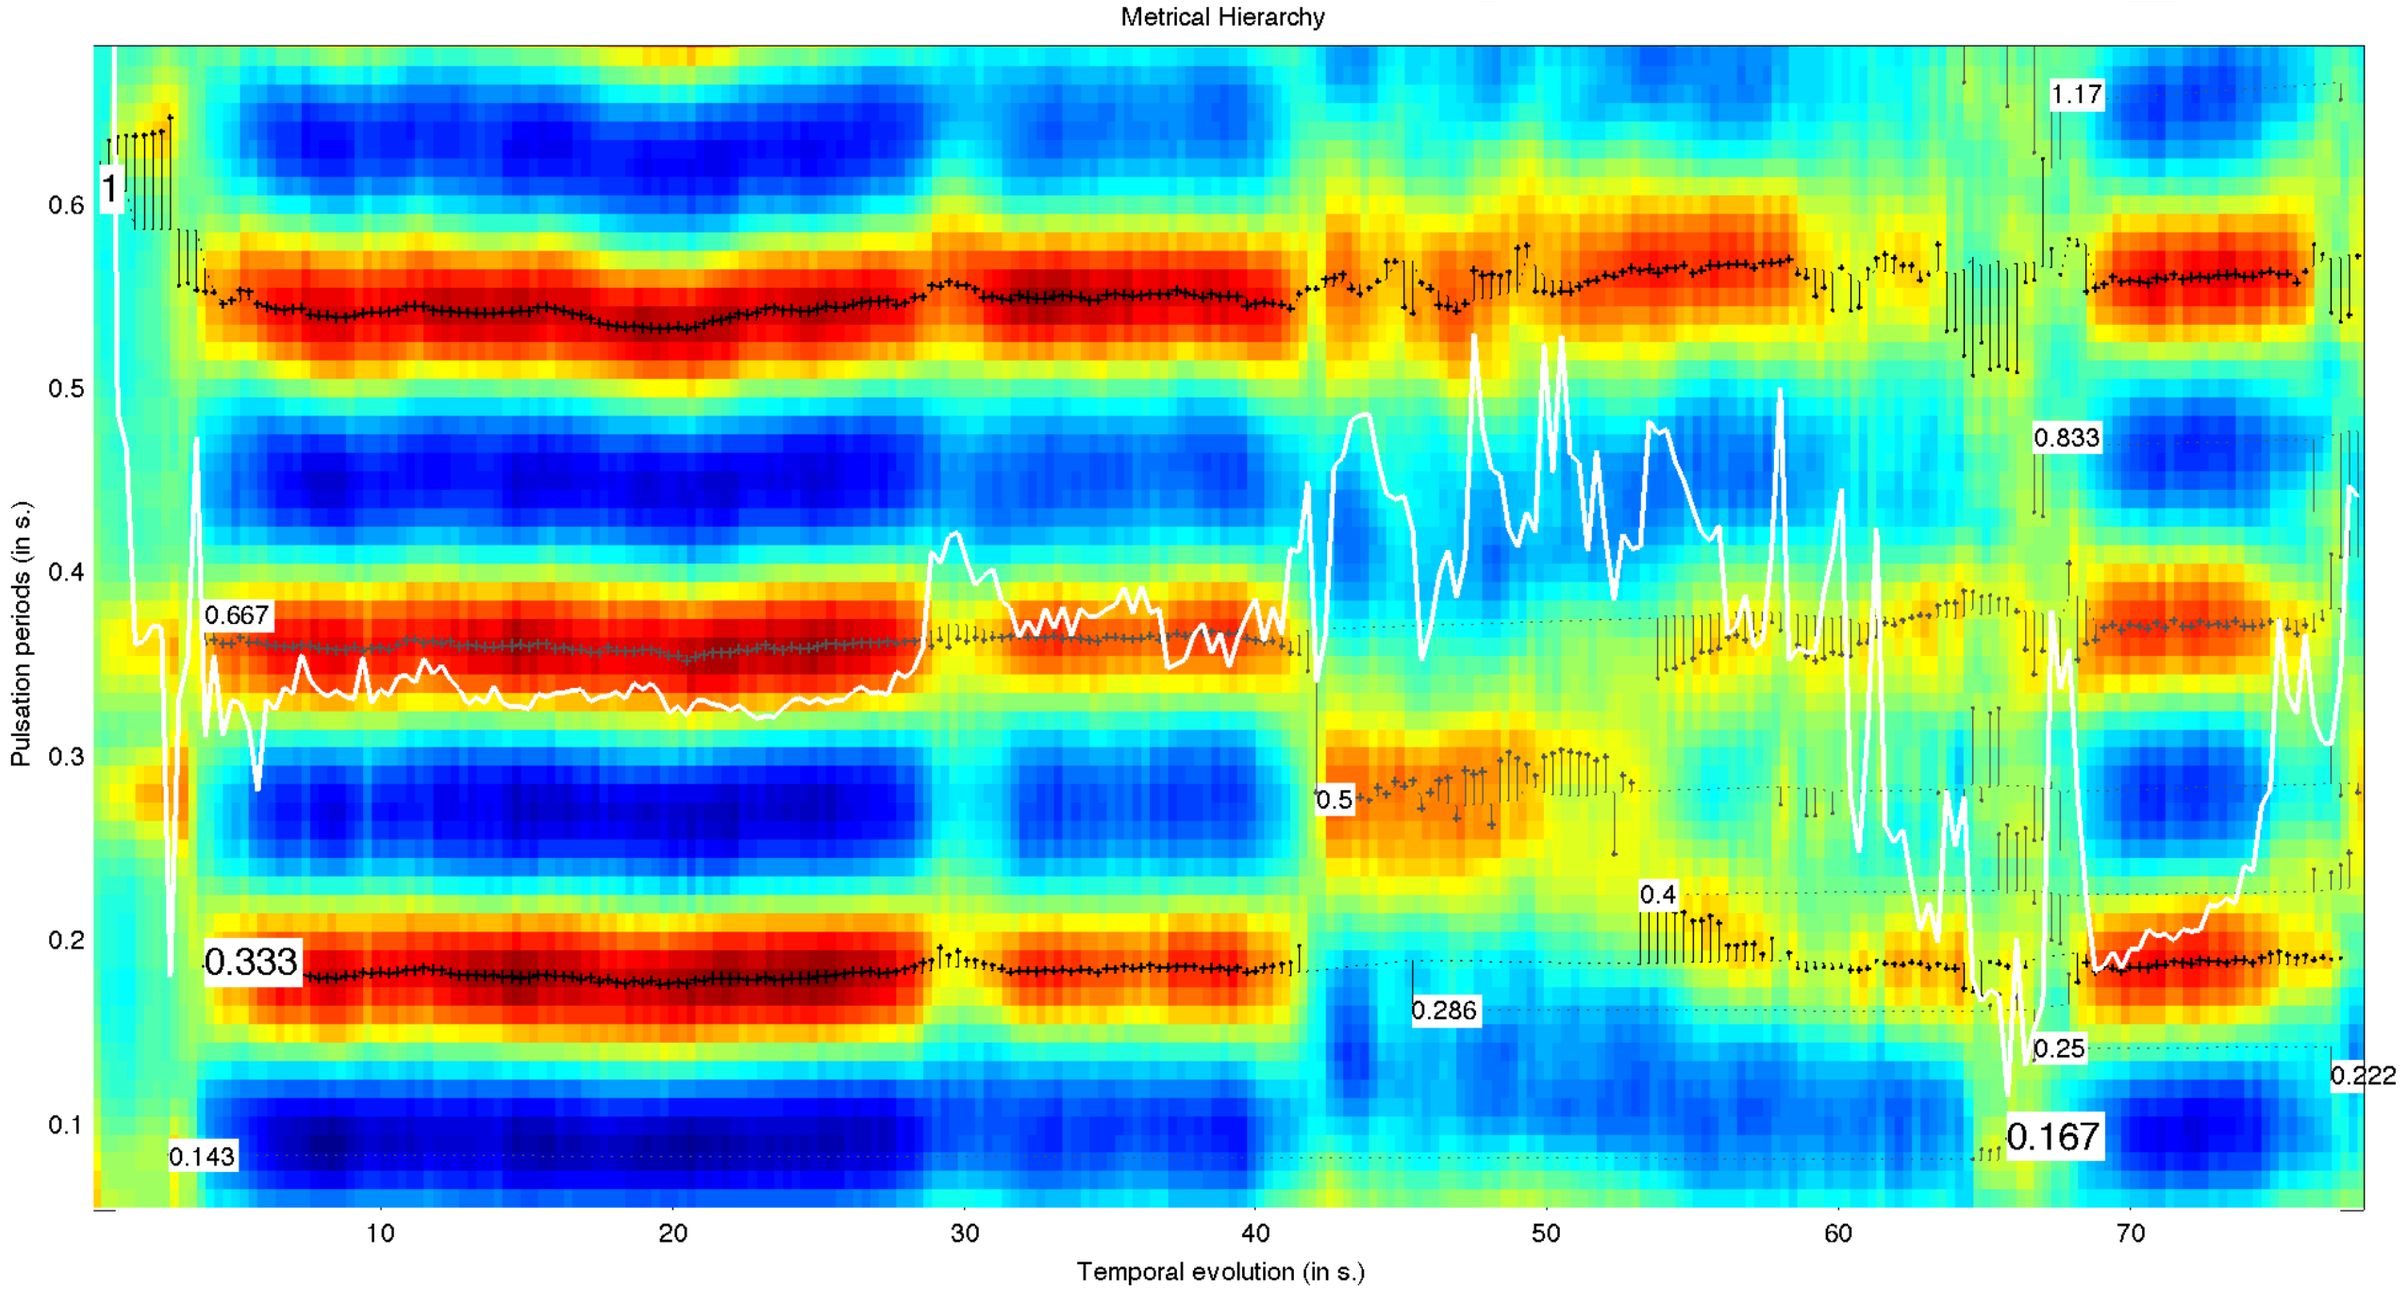
Pulsation does not always focus on one single metrical level.

mus.metre tracks all metrical levels in parallel.



mus.metre

metrical hierarchy tracking

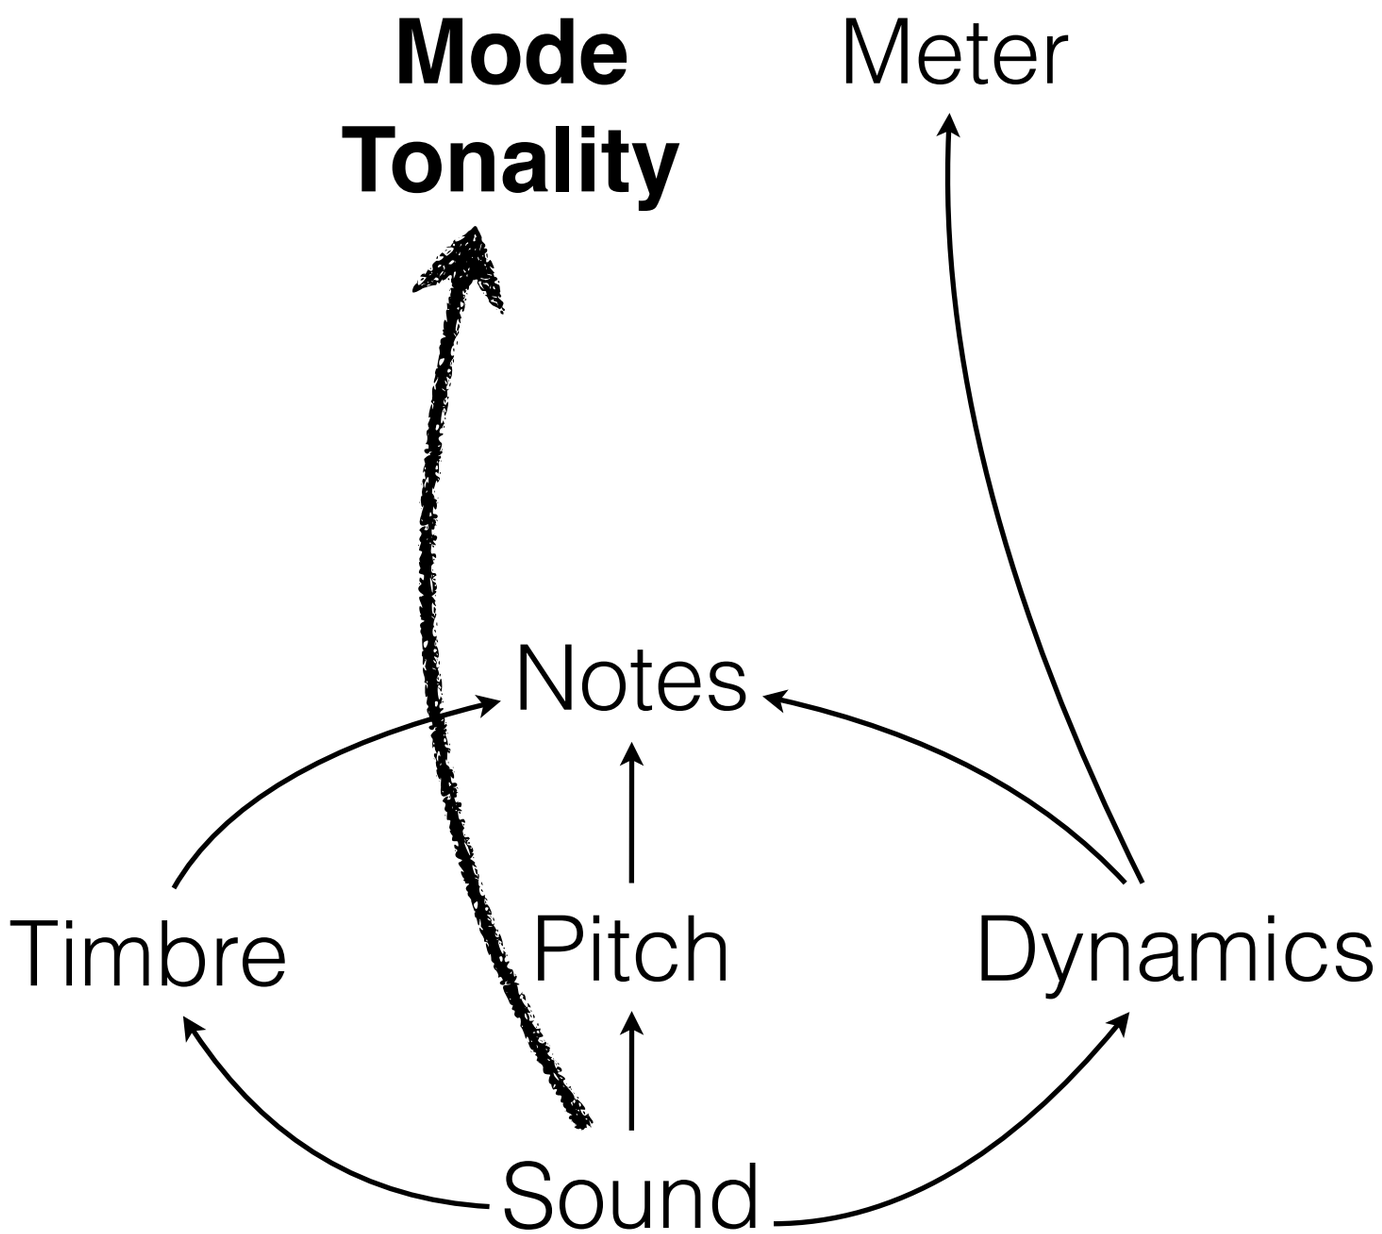


Beethoven, 9th Symphony, *Scherzo*

Structural levels

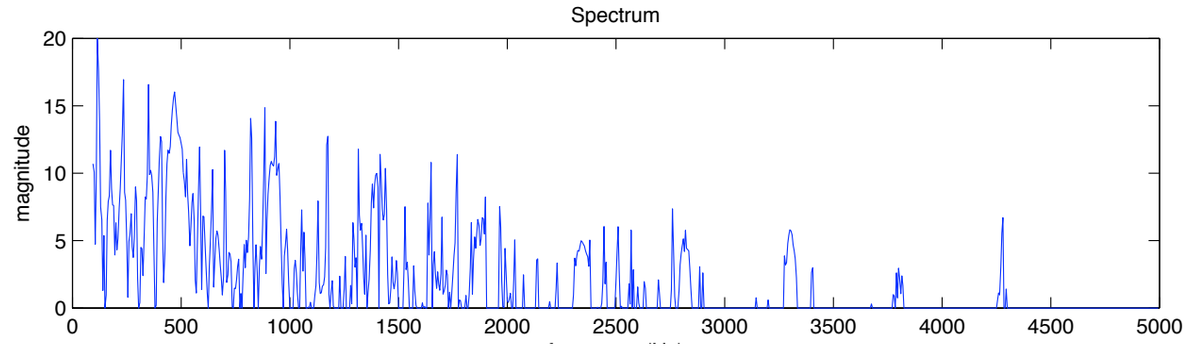
Symbolic level

Audio level

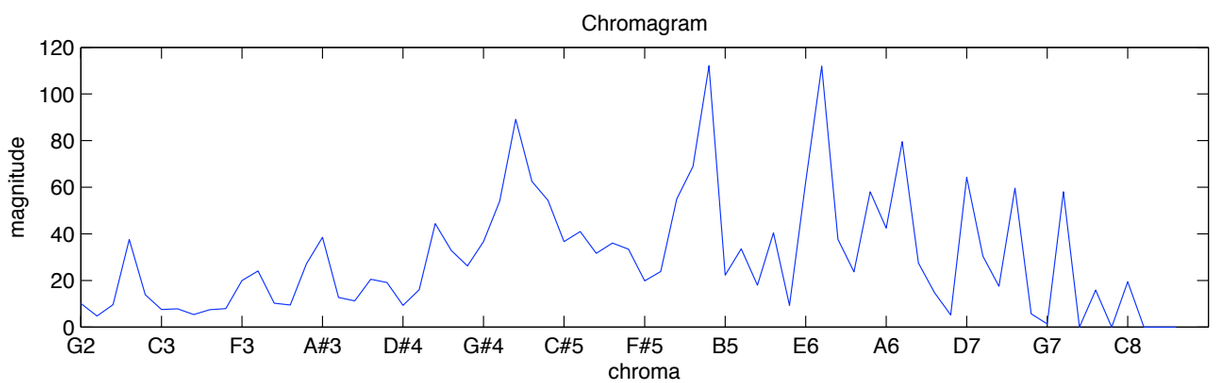


mus.chromagram
energy distribution along pitches

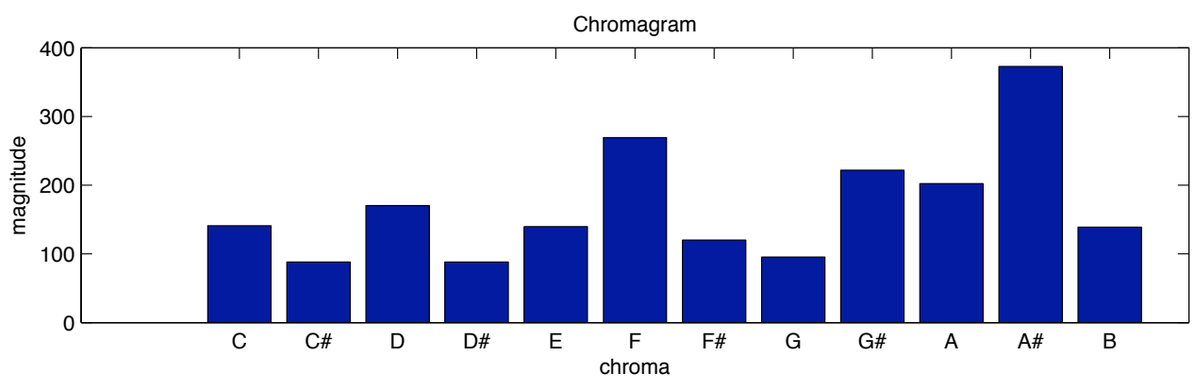
- *s = mirspectrum(a, ‘dB’, 20, 'Min', 100, 'Max', 6400)*



- *c = mirchromagram(s, ‘**Wrap**’, ‘no’)*

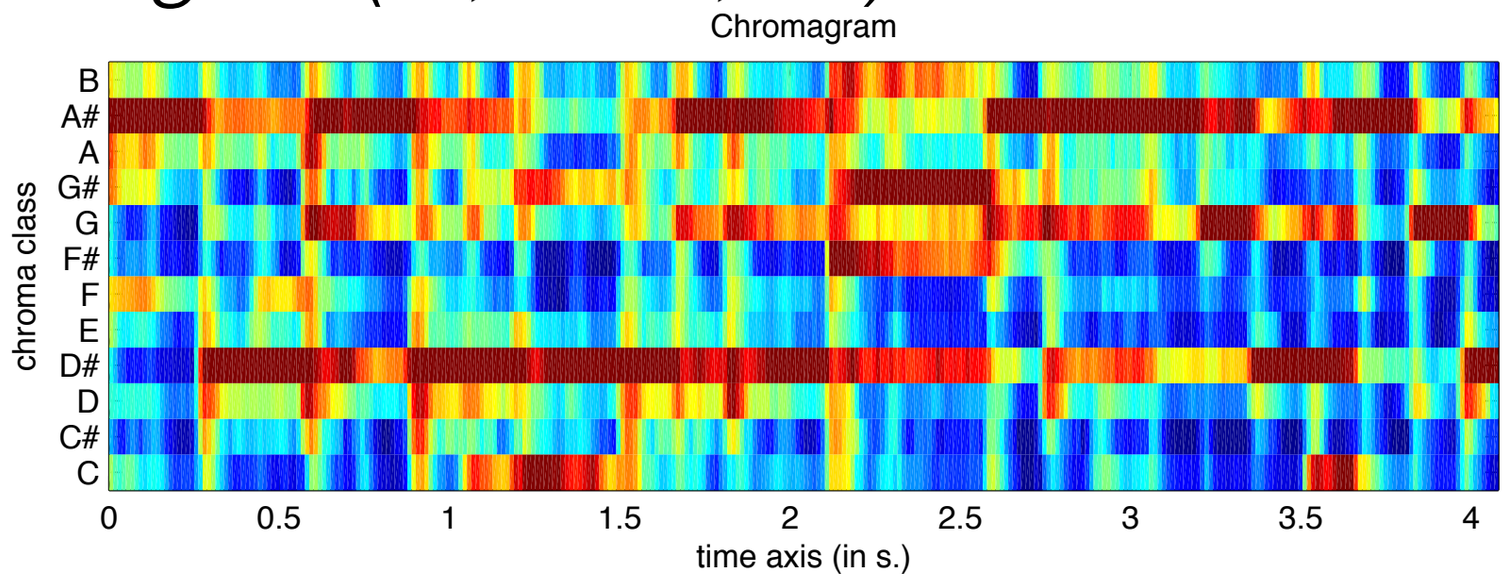


- *c = mirchromagram(c, ‘**Wrap**’, ‘yes’)*

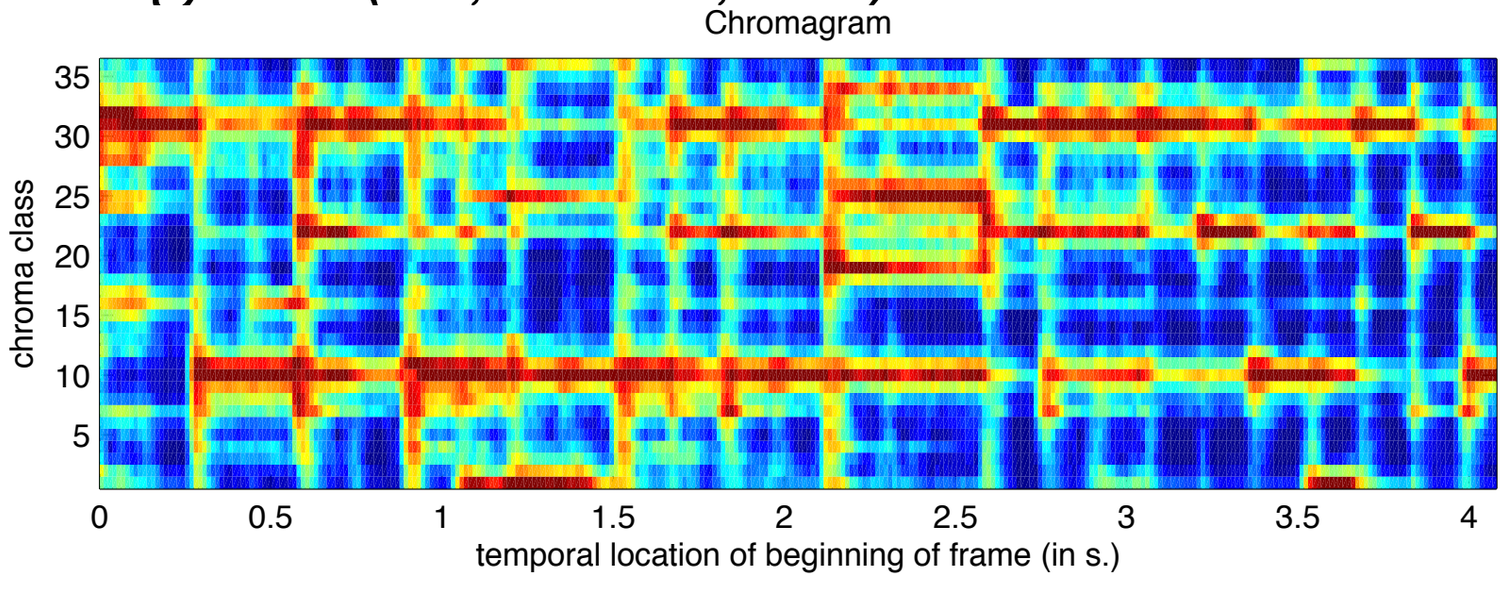


mus.chromagram chroma resolution

- *mirchromagram(..., 'Res', 12)*



- *mirchromagram(..., 'Res', 36)*



mus.keystrength

probability of key candidates

mus.chromagram

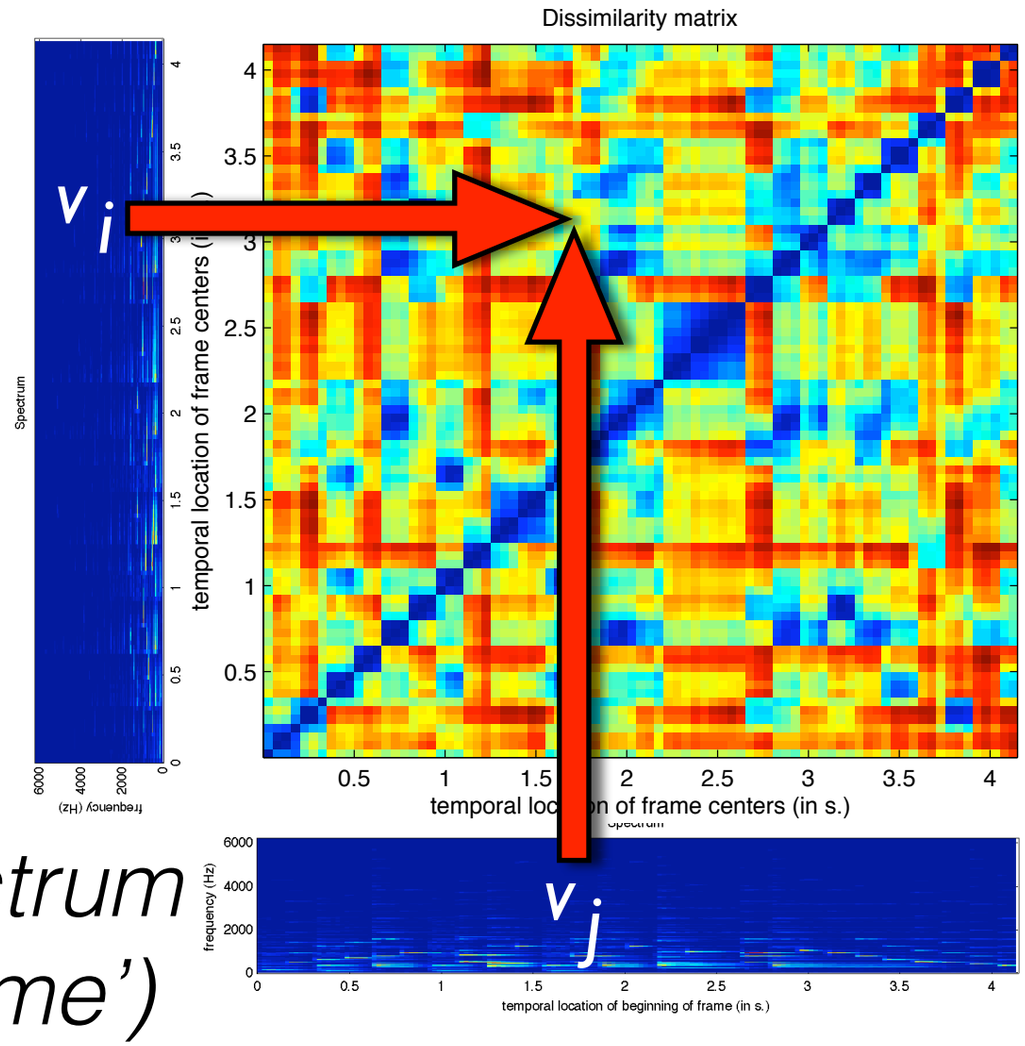
sig.simatrix
*dis*similarity matrix



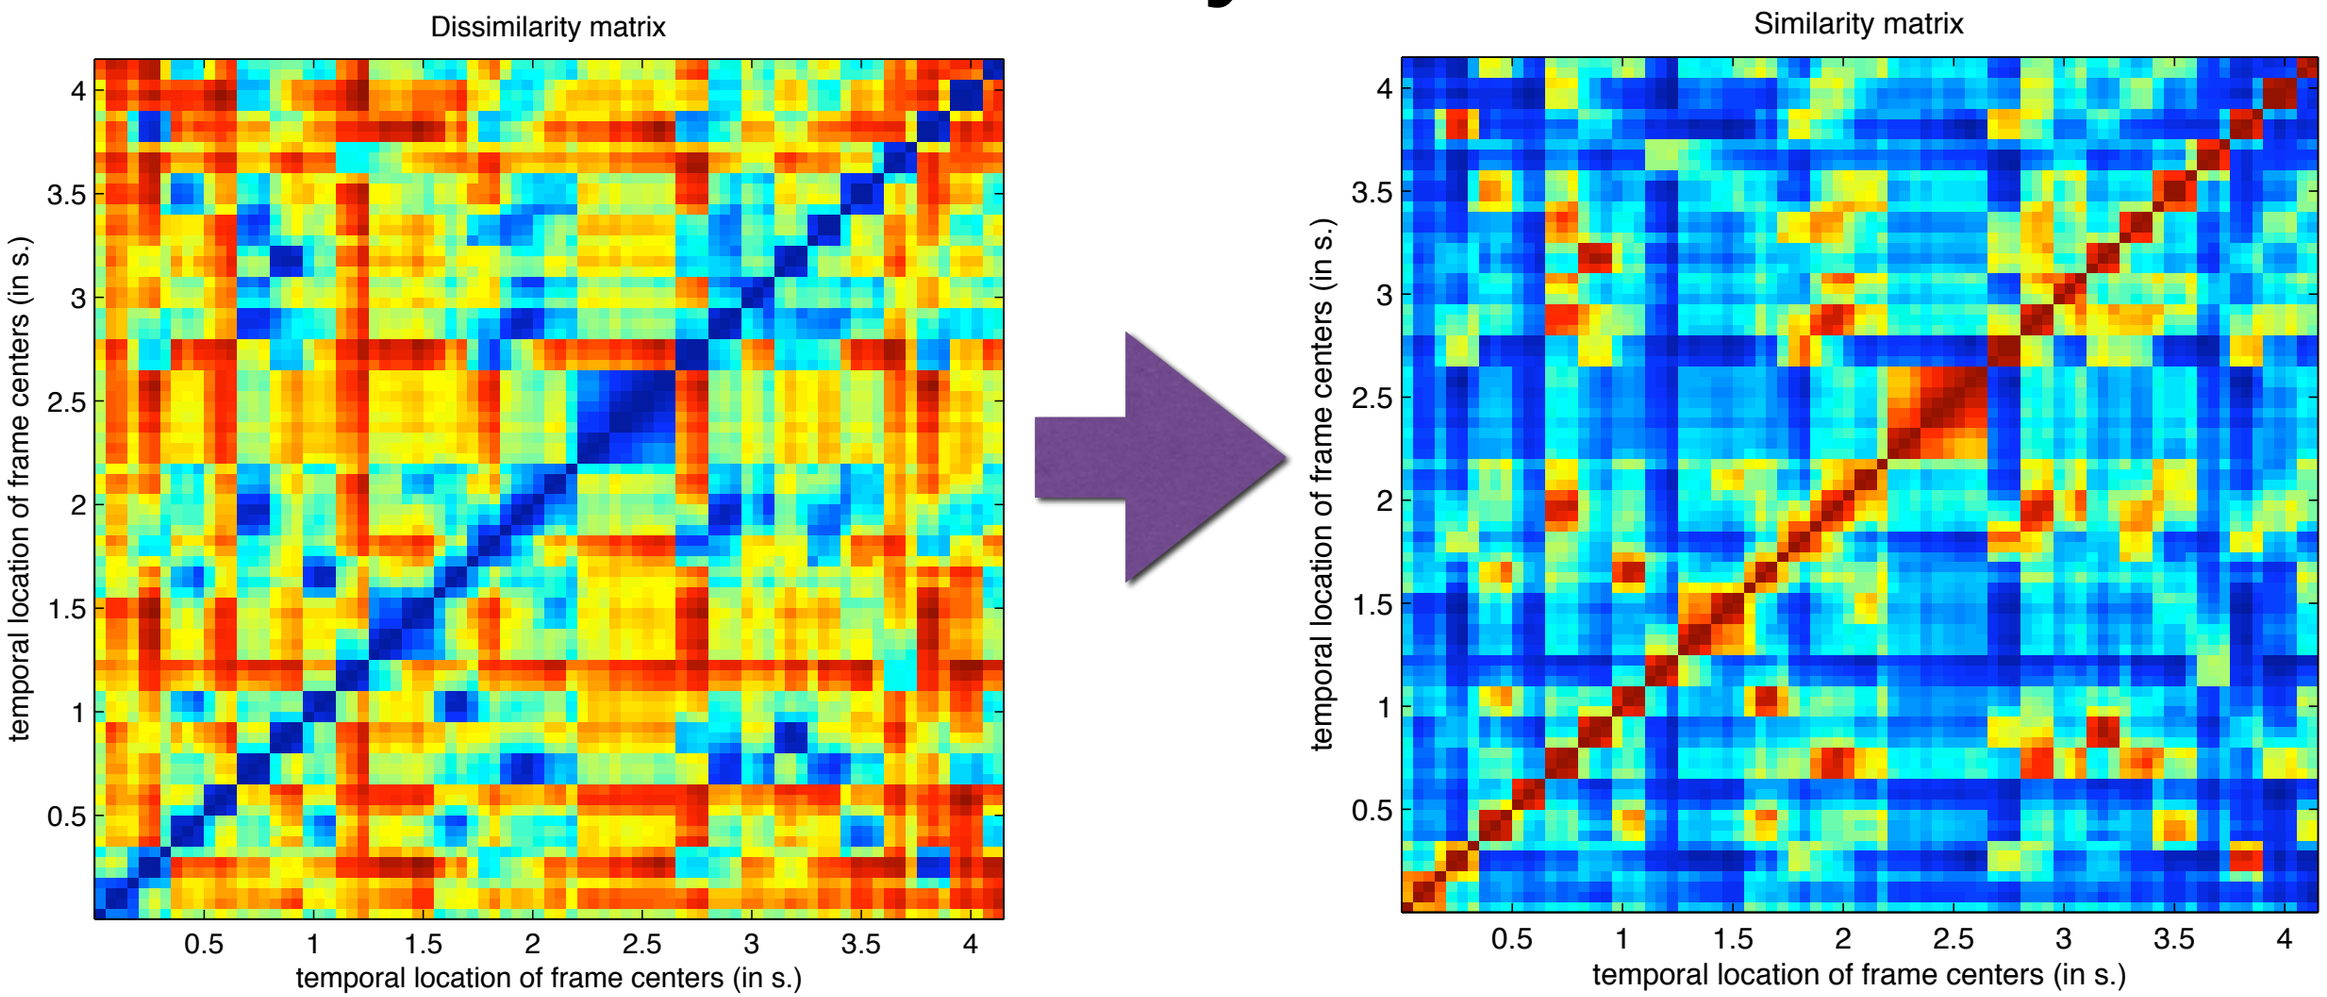
sig.spectrum (…,'Frame')

- *sig.simatrix(a, '**Dissimilarity**')*
- *sig.simatrix(…, '**Distance**', 'cosine')*

$$d_{cos}(v_i, v_j) = \frac{< v_i, v_j >}{|v_i||v_j|}$$

Foote, Cooper. "Media Segmentation using Self-Similarity Decomposition", SPIE Storage and Retrieval for Multimedia Databases, 5021, 167-75.

sig.simatrix
similarity matrix



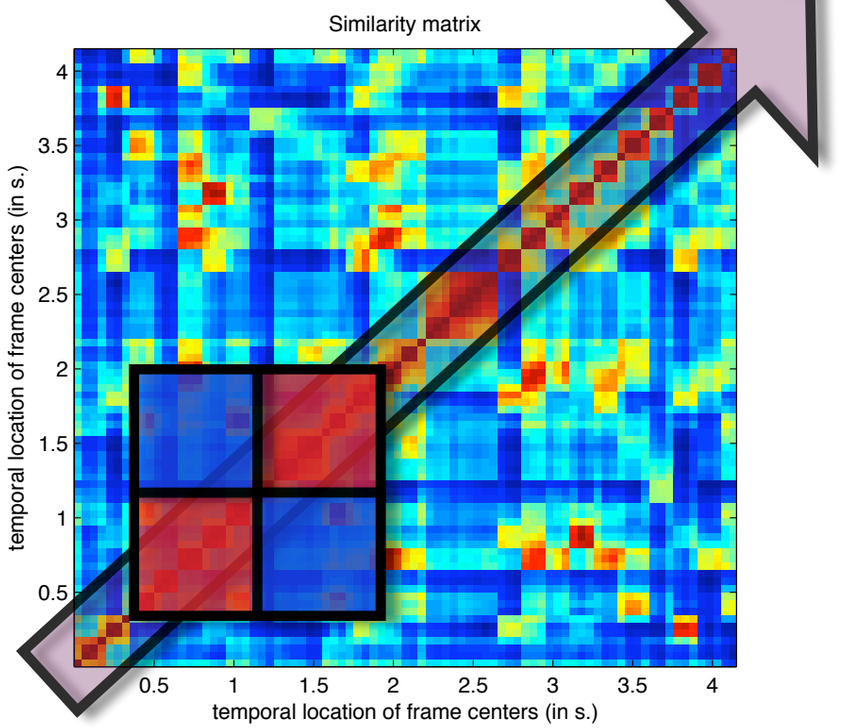
- *sig.simatrix(a, '**Similarity**', 'exponential')*

$$d_{exp}(v_i, v_j) = \exp\left(-d_{cos}(v_i, v_j)\right)$$

Foote, Cooper. "Media Segmentation using Self-Similarity Decomposition", SPIE Storage and Retrieval for Multimedia Databases, 5021, 167-75.

aud.novelty
novelty curve

sig.simatrix(a)



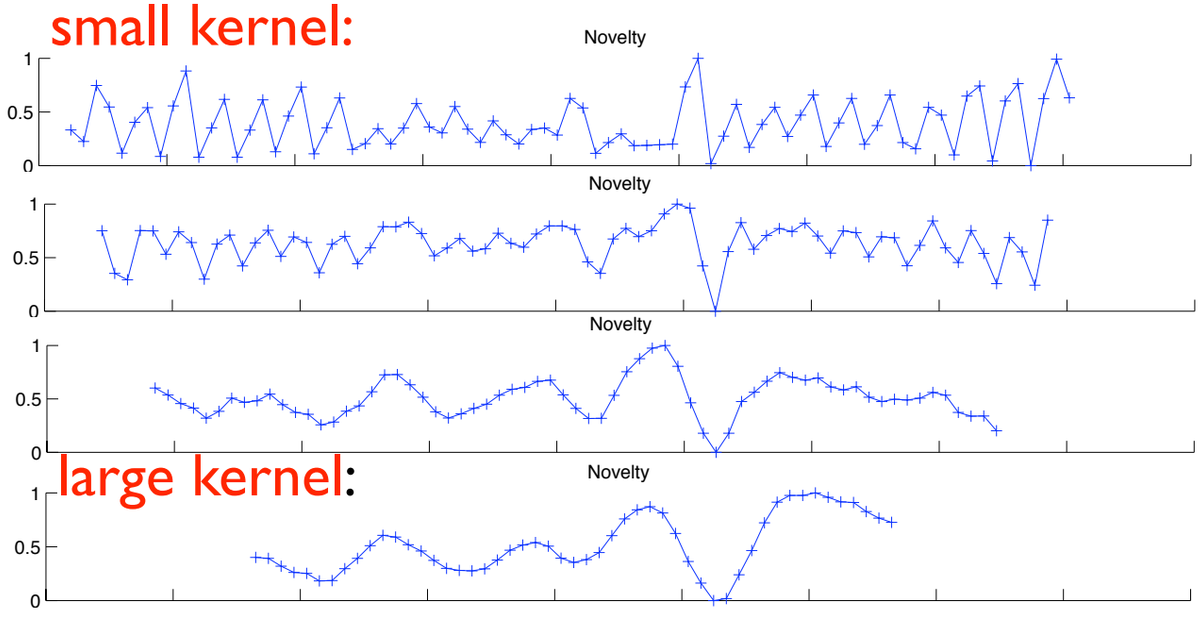
Convolution with Gaussian checkerboard kernel

*aud.novelty(a, '**KernelSize**', s)*

s = 128 samples

small kernel:

large kernel:

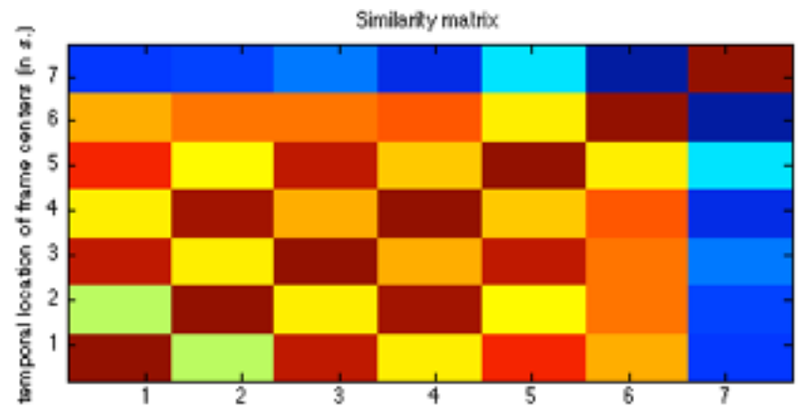


Foote, Cooper. "Media Segmentation using Self-Similarity Decomposition", SPIE Storage and Retrieval for Multimedia Databases, 5021, 167-75.

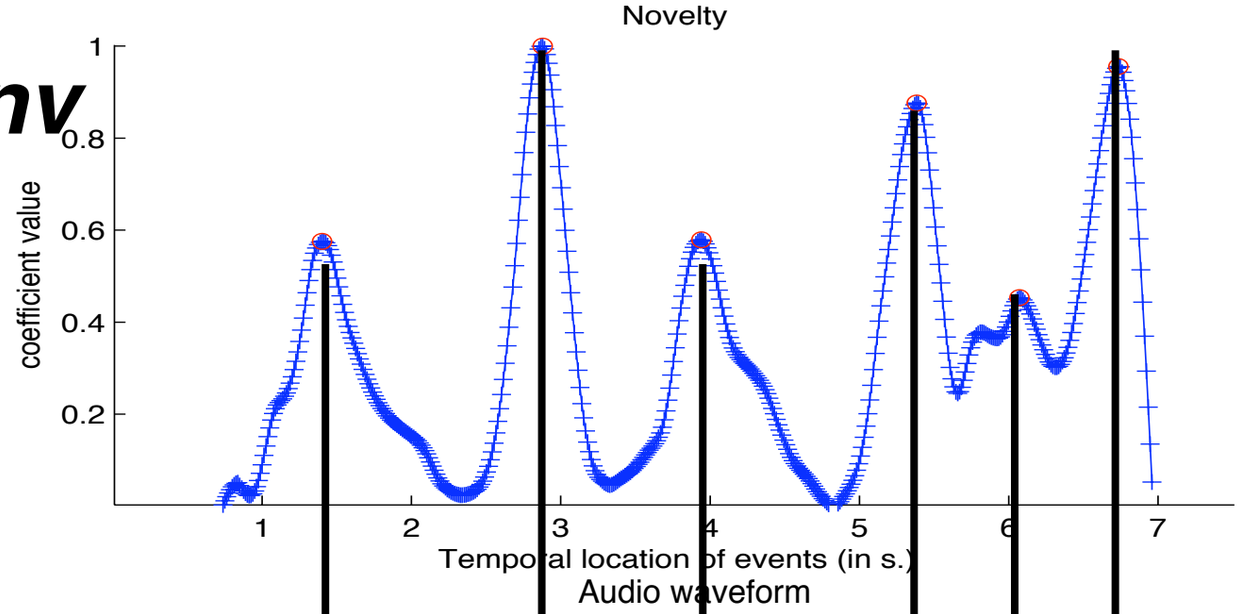
aud.segment novelty-based segmentation

- *nv = aud.novelty(sm)*
- *sg = sig.segment('mysong', nv)*
- *sg = sig.segment('mysong')*
- *aud.play(sg)*
- *s = aud.mfcc(sg)*
- *sm = sig.simatrix(s)*

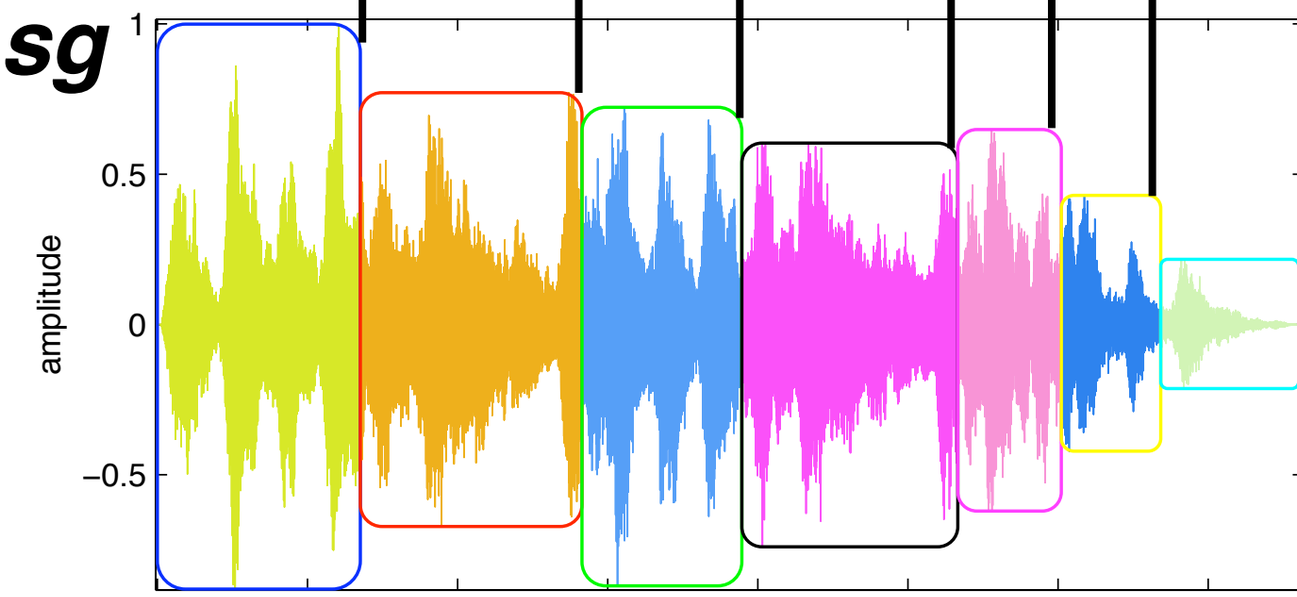
sm



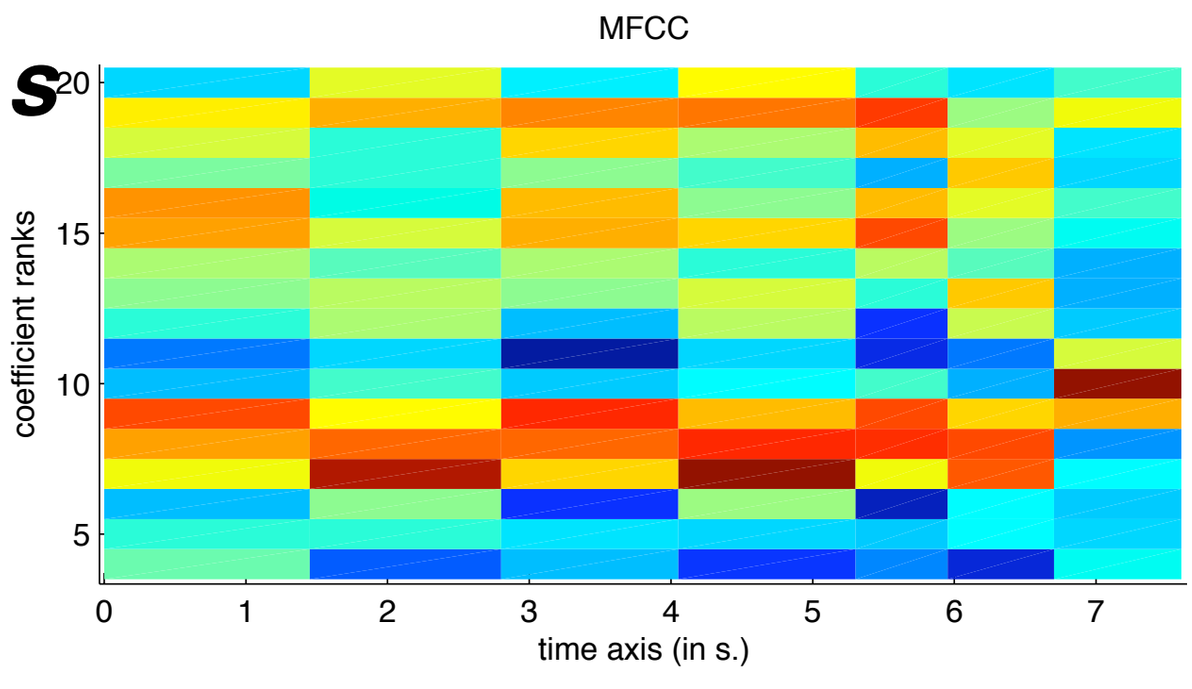
nv



sg

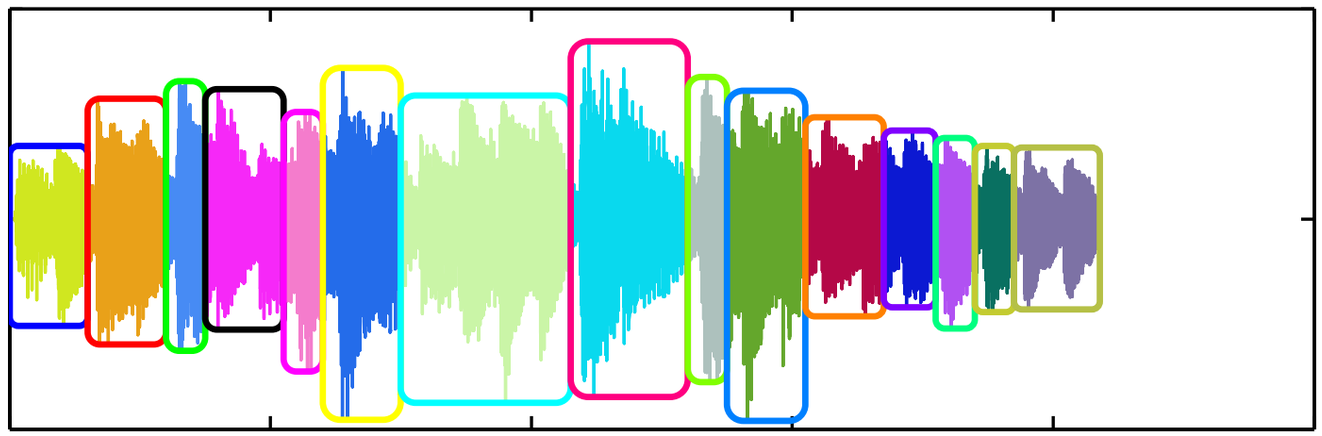


s

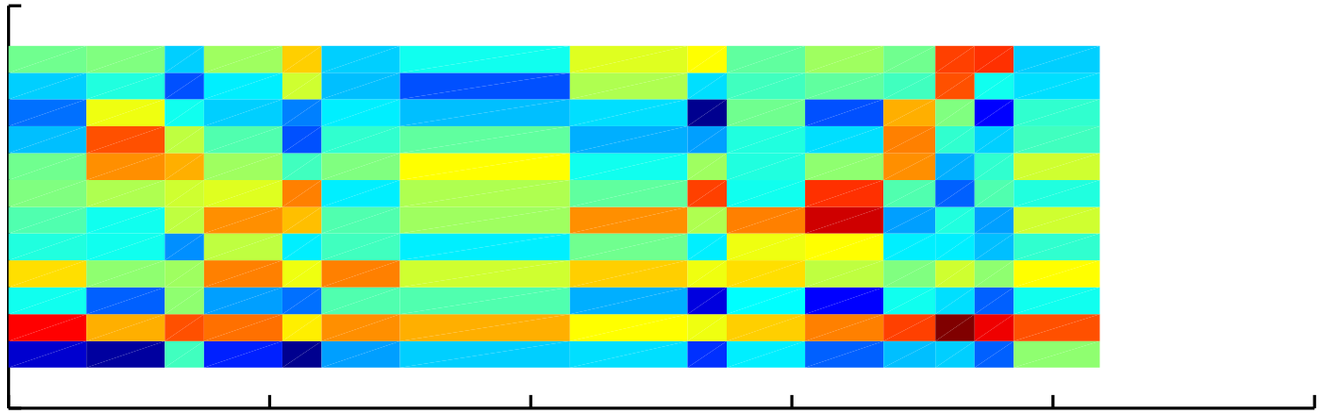


sig.cluster
clustering of audio segments

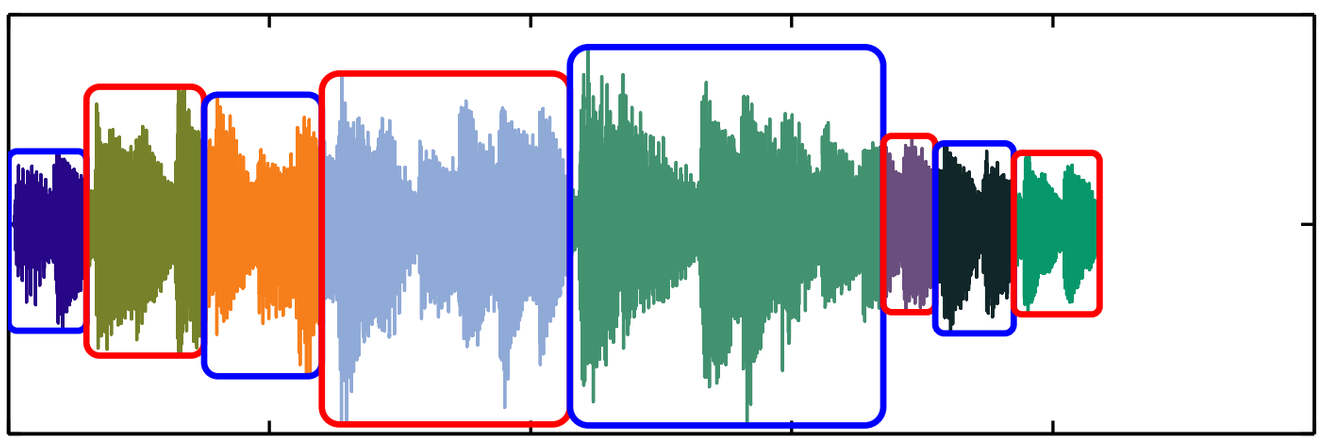
- *sg = aud.segment(a)*



- *cc = aud.mfcc(sg)*

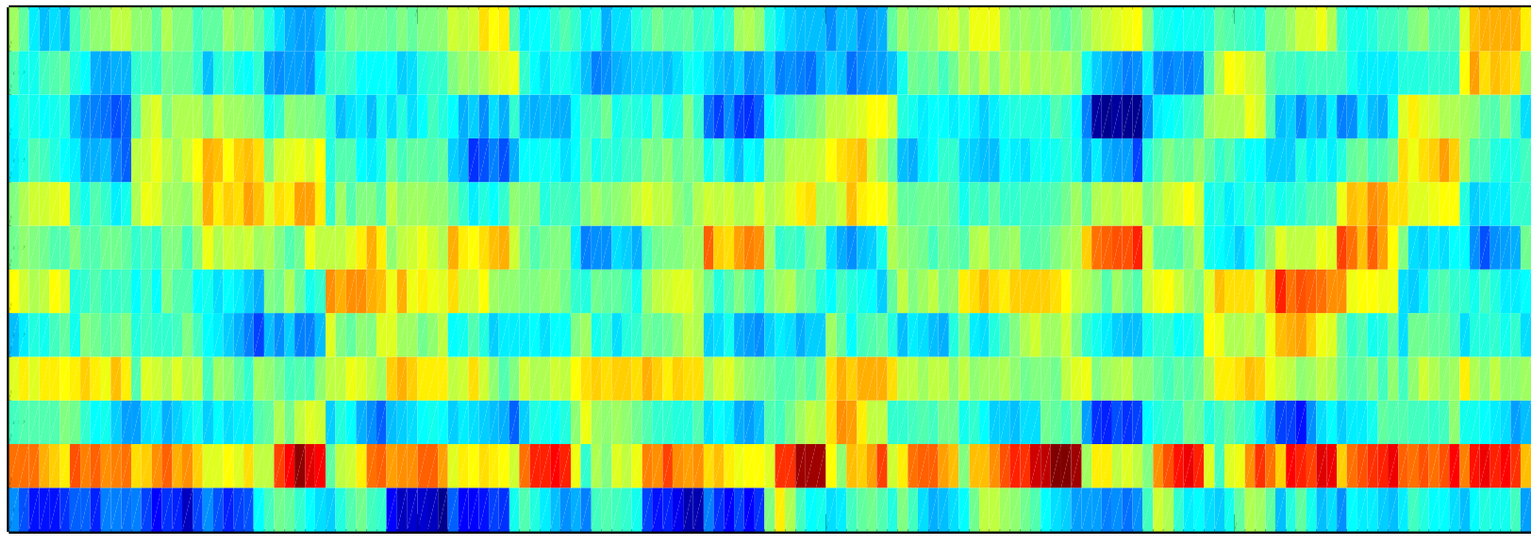


- *sig.cluster(sg, cc)*

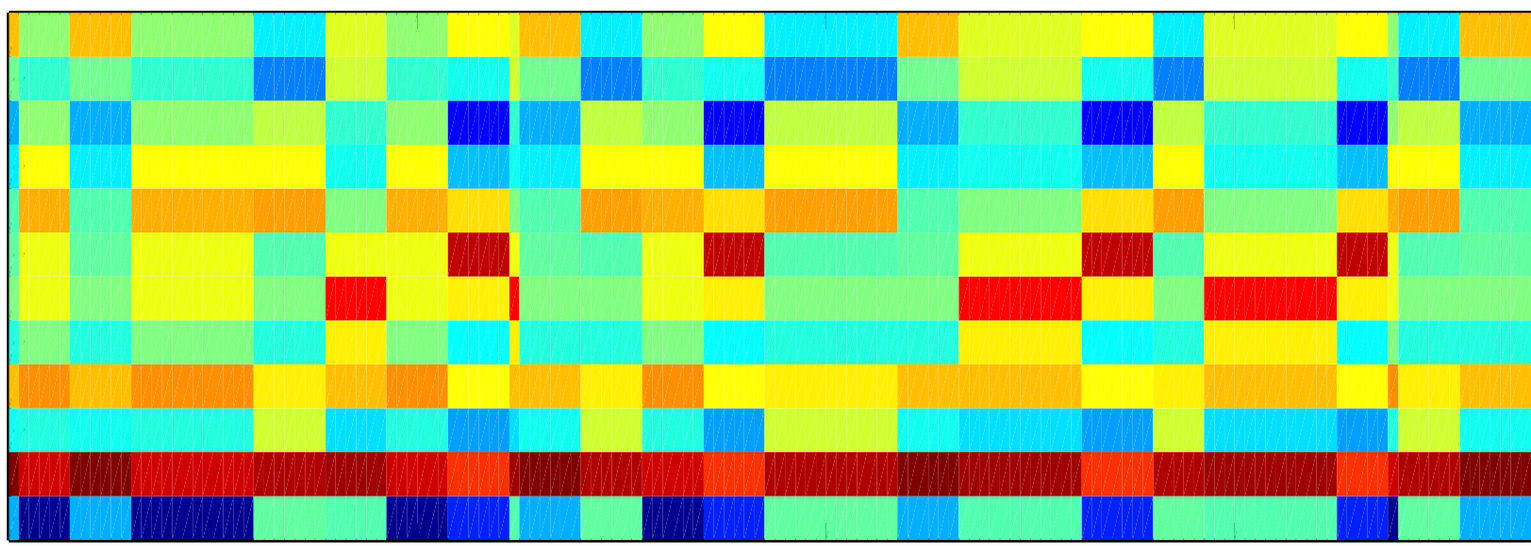


sig.cluster
clustering of frame-decomposed feature

- *cc = aud.mfcc(…, 'Frame')*



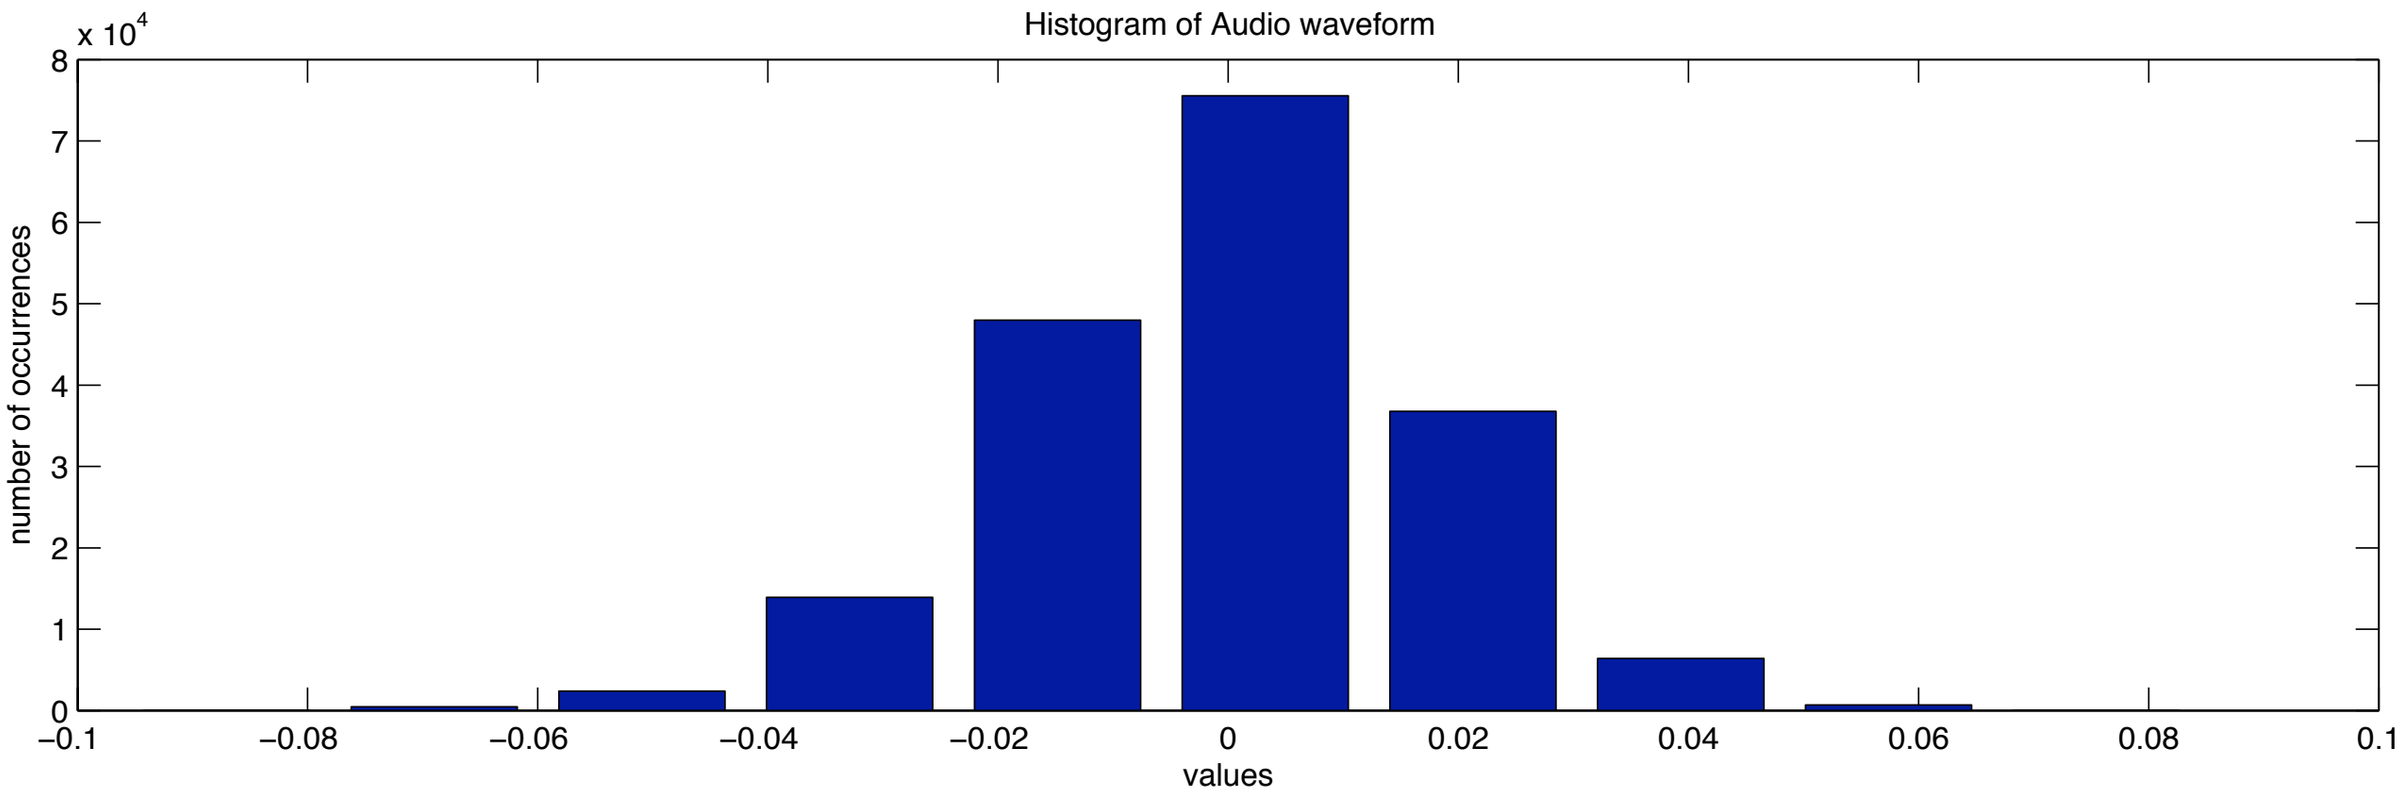
- *sig.cluster(cc, 4)*



sig.stat
basic statistics

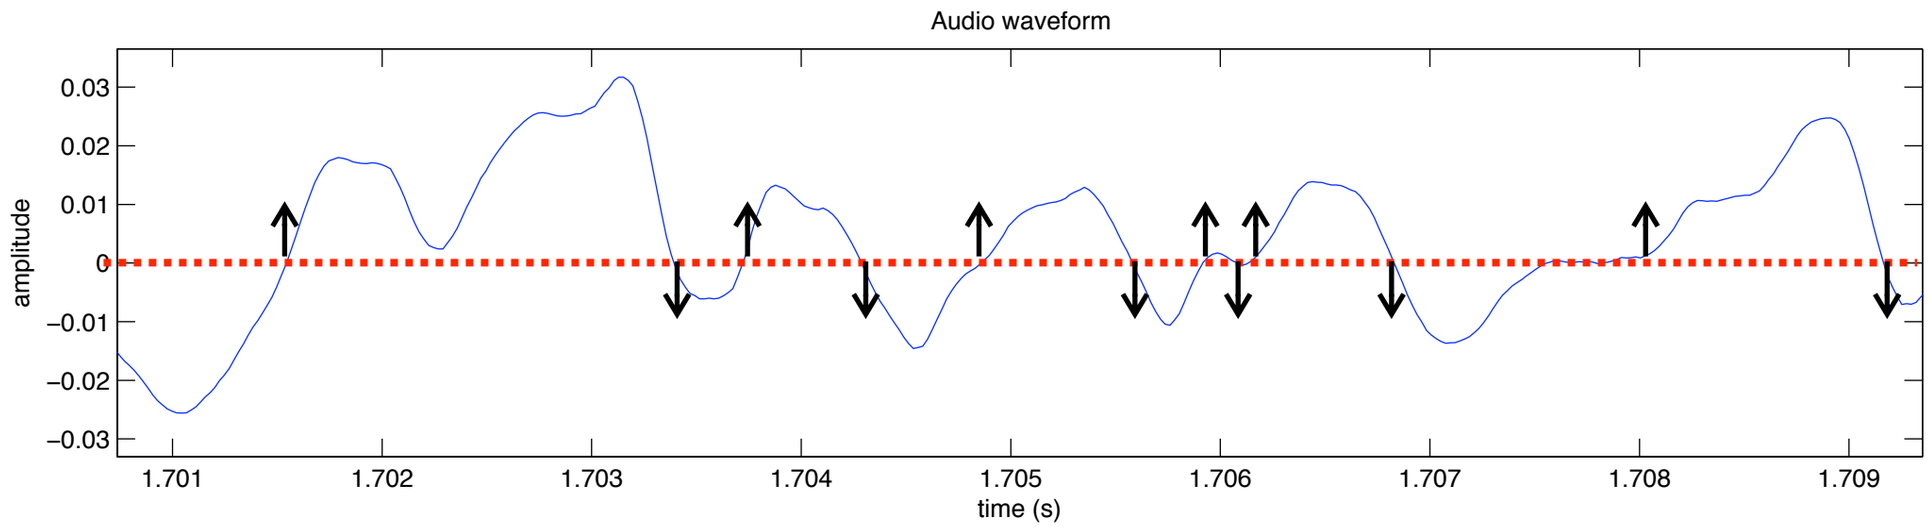
- mean
- standard deviation
- temporal slope
- main periodicity:
  - frequency
  - amplitude
  - periodicity entropy

sig.histo
histogram



*sig.histo(…, '**Number**',10)*

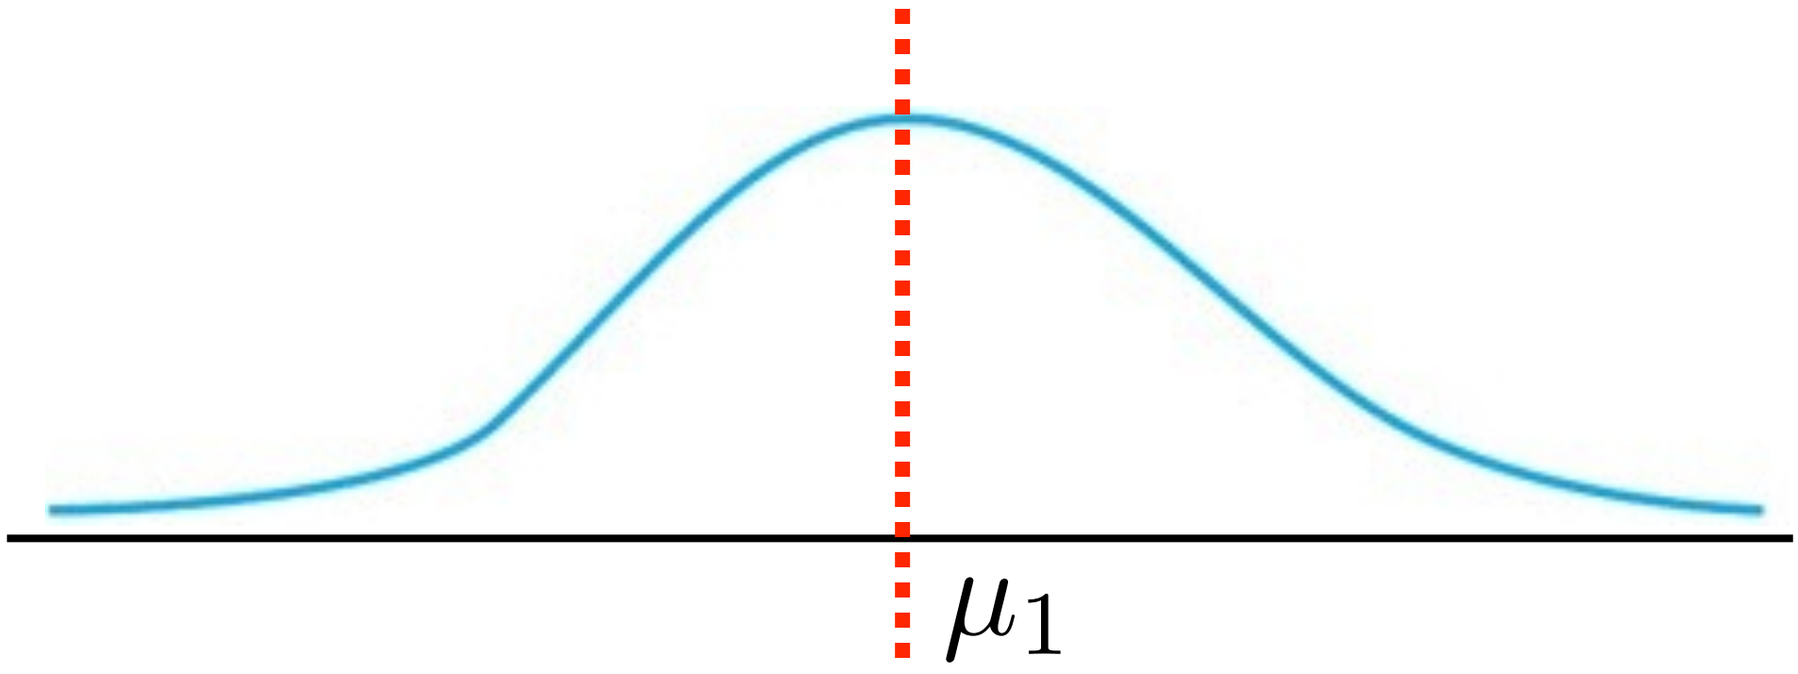
sig.zerocross
waveform sign-change rate



- on any curve
- sig.zerocross(…, ‘**Per**’, ‘**Second**’): rate per second
- sig.zerocross(..., ‘Per’, ‘**Sample**’): rate per sample
- sig.zerocross(..., ‘**Dir**’, ‘**One**’): only ↑ or ↓
- sig.zerocross(..., ‘Dir’, ‘**Both**’): both ↑ and ↓

sig.centroid
geometric center

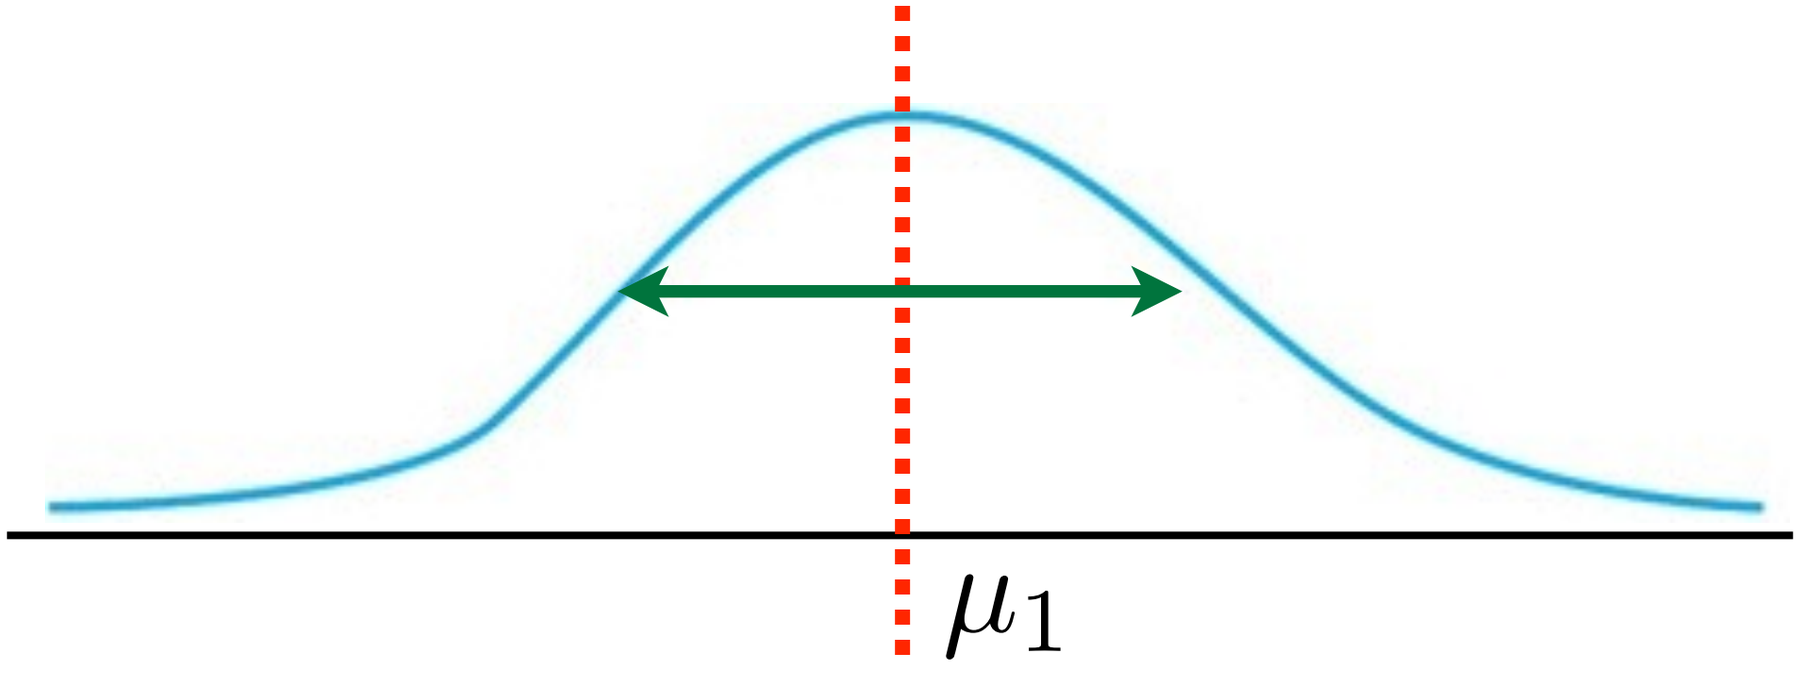
first moment: $\mu_1 = \int x f(x) dx$



sig.spread
variance, dispersion

second moment: $\sigma^2 = \mu_2 = \int (x - \mu_1)^2 f(x) dx$

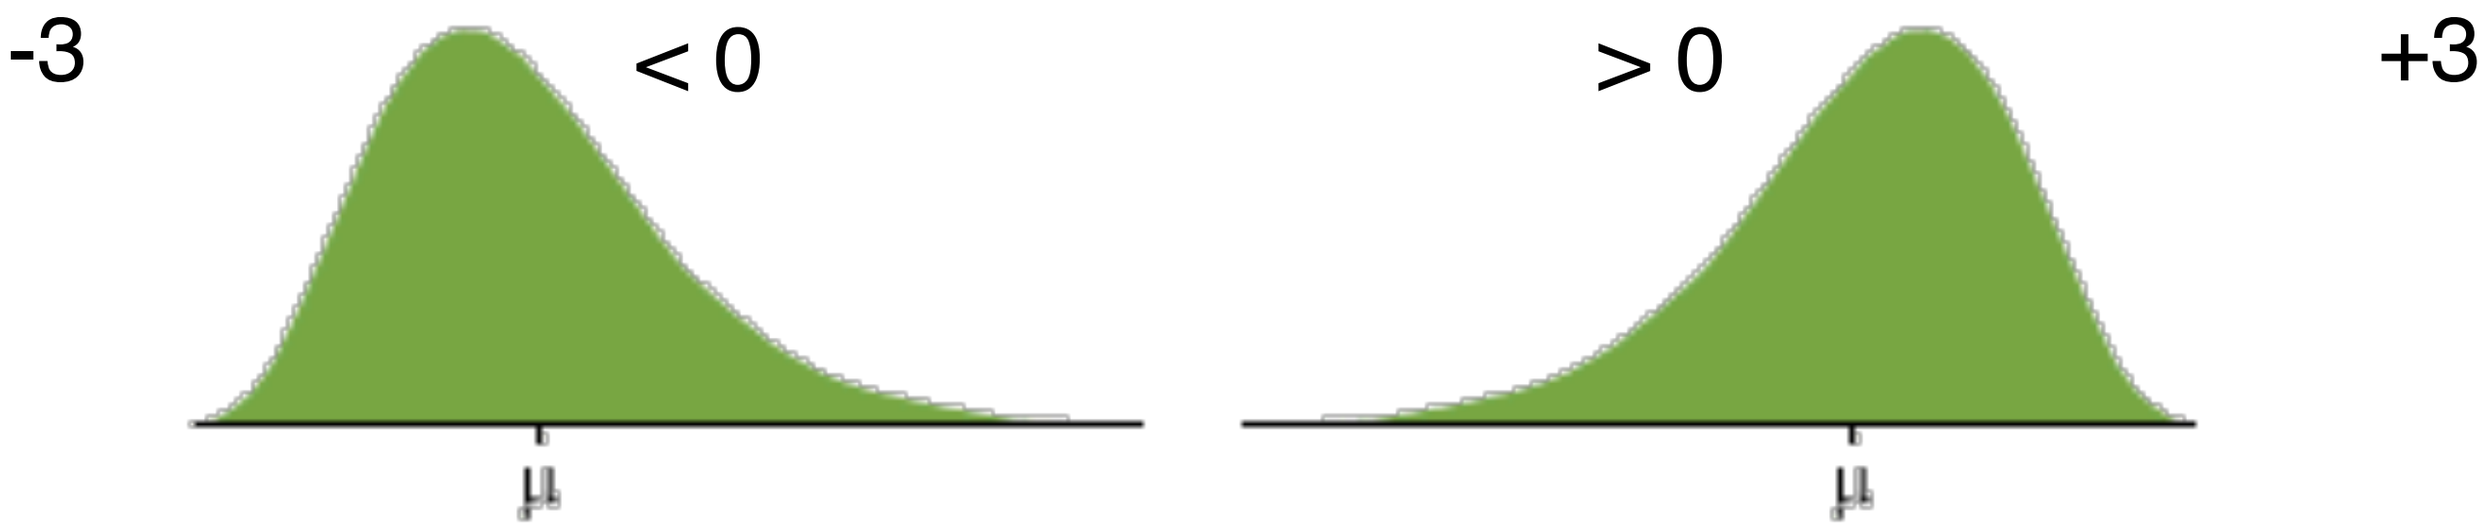
standard deviation: σ



sig.skewness
non-symmetry

third moment: $\mu_3 = \int (x - \mu_1)^3 f(x) dx$

third standardized moment: $\frac{\mu_3}{\sigma^3}$

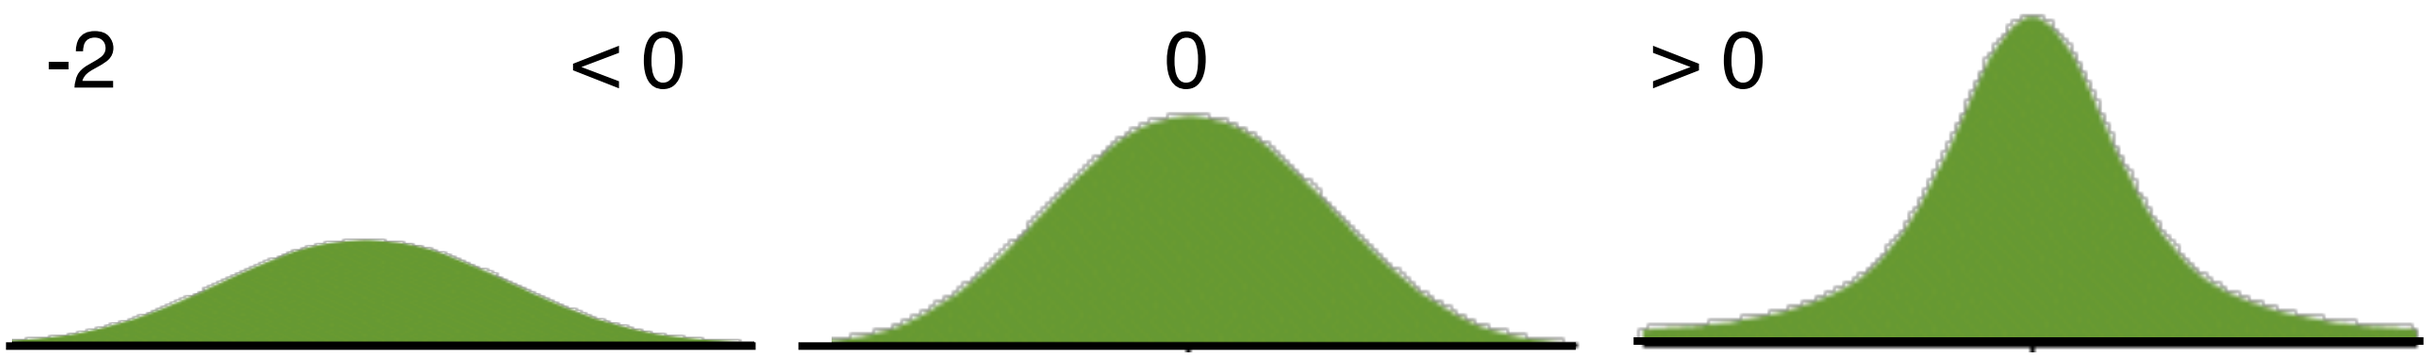


sig.kurtosis
pickiness

fourth moment: $\mu_4 = \int (x - \mu_1)^4 f(x) dx$

fourth standardized moment: $\frac{\mu_4}{\sigma^4}$

excess kurtosis: $\frac{\mu_4}{\sigma^4} - 3$



sig.flatness
smooth vs. spiky

$$\frac{\text{geometric mean}}{\text{arithmetic mean}} \quad \frac{\sqrt[N]{\prod_{n=0}^{N-1} x(n)}}{\left(\frac{\sum_{n=0}^{N-1} x(n)}{N}\right)}$$

sig.entropy
relative Shannon entropy

- Data considered as probability distribution:
  - p≥0: half-wave rectification
  - ∑p=1: normalization
- Shannon entropy: $H(p) = -\sum(p \ log(p))$
- Relative entropy, independent on the sequence length:

$$H(p) = -\sum(p \ log(p)) / log(length(p))$$

- Entropy gives an indication of the curve:
  - High entropy ≈ uncertainty ≈ flat curve
  - Low entropy ≈ certainty ≈ peak(s)

Shannon, C. E. 1948. “A Mathematical Theory of Communication.” Bell Systems Technical Journal 27:379–423.

sig.export
exportation of statistical data to files

- *sig.export(filename, ...)* adding one or several data from *MiningSuite* operators.

- *sig.export('result.txt', ...)* saved in a text file.

- *sig.export('result.arff', ...)* exported to WEKA for data-mining.

- *sig.export('Workspace', ...)* saved in a *Matlab* variable.

aud.play
feature-based playlist

- *zc = sig.zerocross('Folder');*

- *aud.play('Folder', '**Increasing**', zc)*

  - Plays the folder of audio files in increasing order of zero-crossing rate.

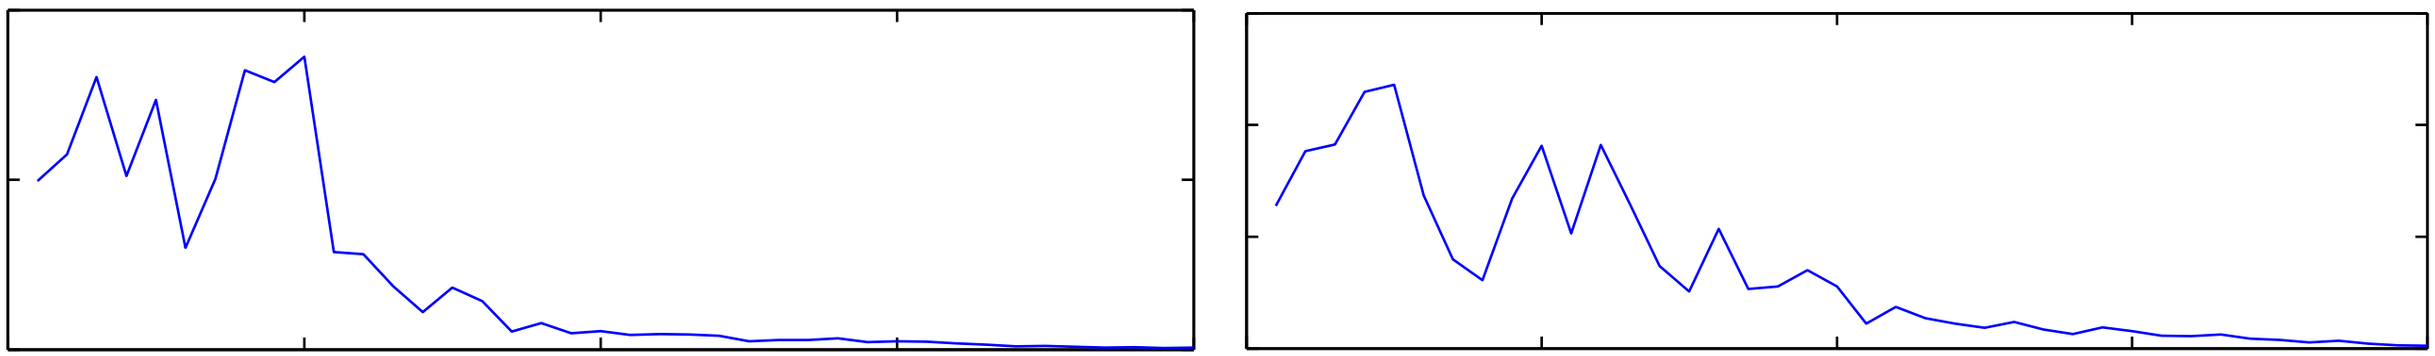
- *aud.play('Folder', 'Increasing', zc, '**Every**', 5)*

  - Plays one out of five audio files.

sig.classify
classification

sig.dist
distance between features

- *s1 = aud.spectrum('a','Mel')*
- *s2 = aud.spectrum('b','Mel')*



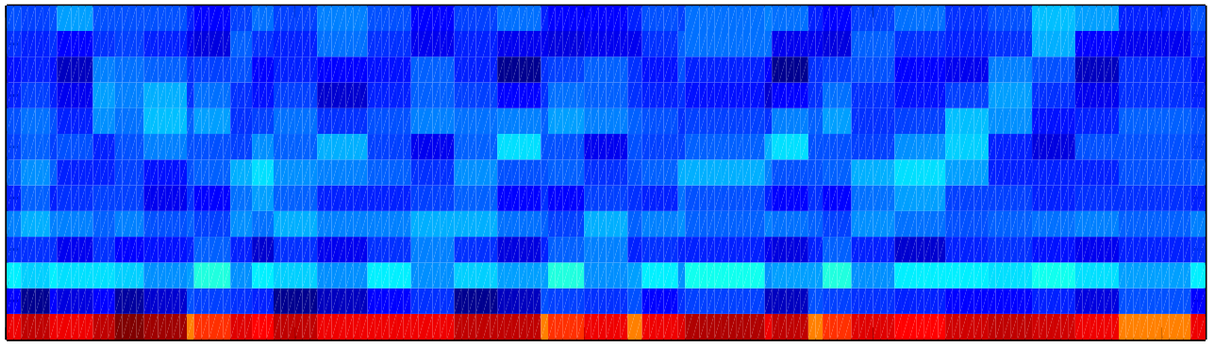
- *sig.dist(s1, s2, 'Cosine')*

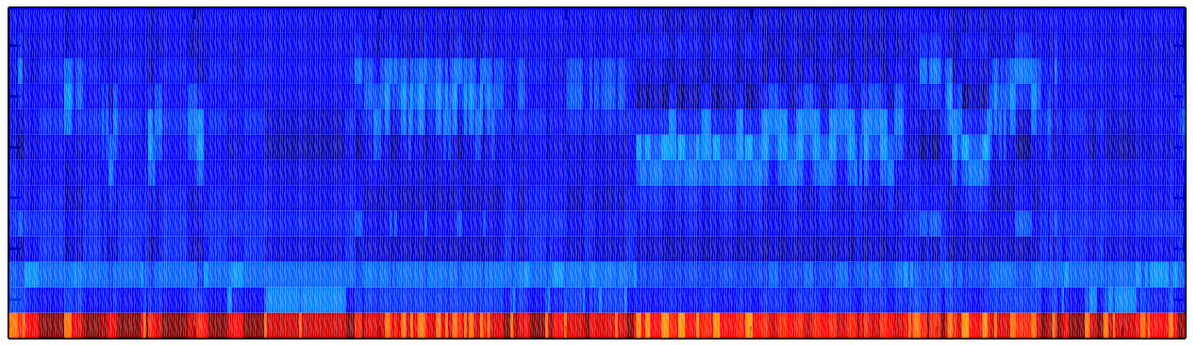
```
The Mel-Spectrum Distance between files a and b is 0.1218
```

sig.dist
distance between clusters

- *c1 = aud.mfcc('a','Frame')*
- *c1 = sig.cluster(c1, 16)*

- *c2 = aud.mfcc('b','Frame')*
- *c2 = sig.cluster(c2, 16)*





Earth Mover's Distance between clusters

- *sig.dist(c1, c2)*

```
The MFCC Distance between files a and b is 19.3907
```

sig.dist

sig.signal
Accessing fields

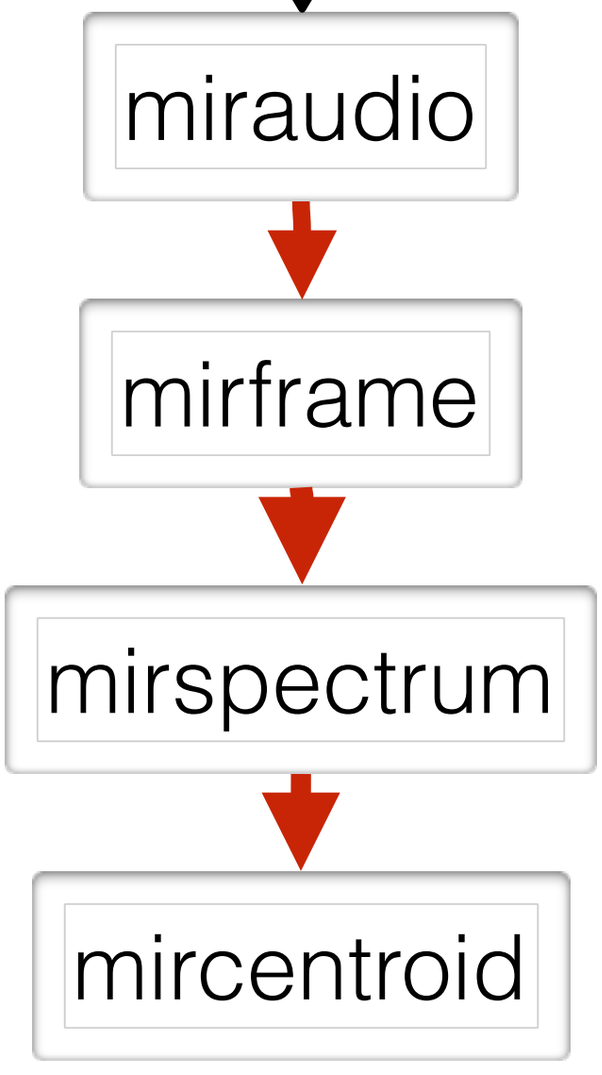
a = *sig.spectrum(…, 'Frame')* ⟶ *sig.signal* object **a**

- a.**xname** = 'Frequency'
- a.**xunit** = 'Hz'
- a.**xdata**: frequency bins, recomputed on the fly
  - a.**xstart** = 0
  - a.**xsampling** = 10.766
- a.**sdata** = frame positions, recomputed on the fly
  - a.**Sstart** = 0
  - a.**Srate** = 40

- a.**yname** = 'Spectrum'
- a.**Ydata** = *sig.data* object
  - a.Ydata.**dims** = {'*element*', '*sample*'}
  - a.Ydata.**content**: Matlab matrix
    - rows are frequencies ('*element*')
    - columns are frames ('*sample*')

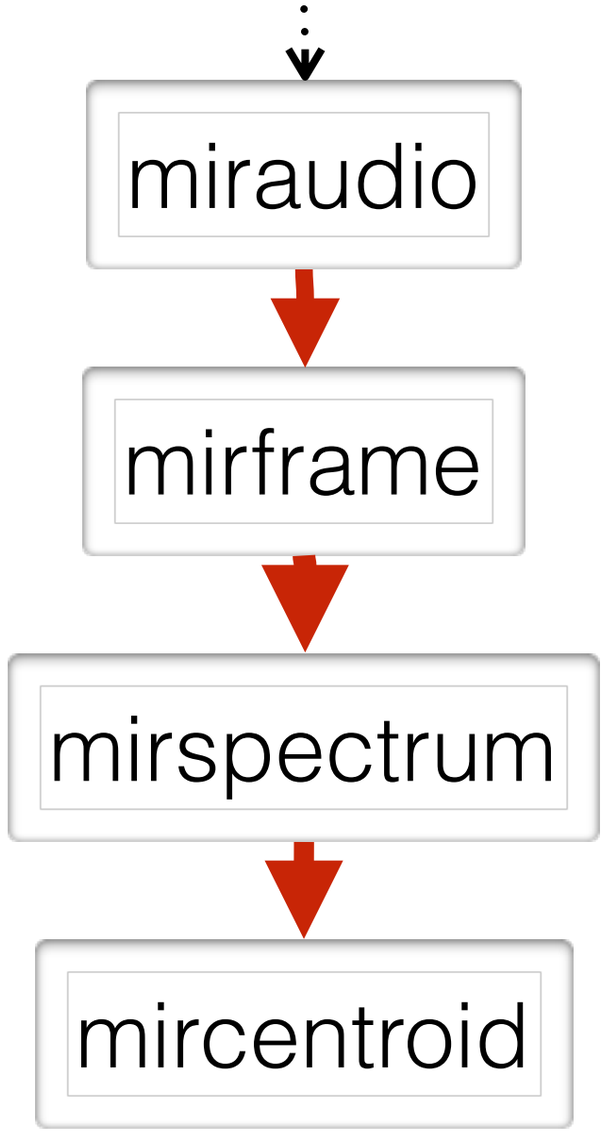
Limitations of data flow in *MIRtoolbox*

long audio file,
batch of files



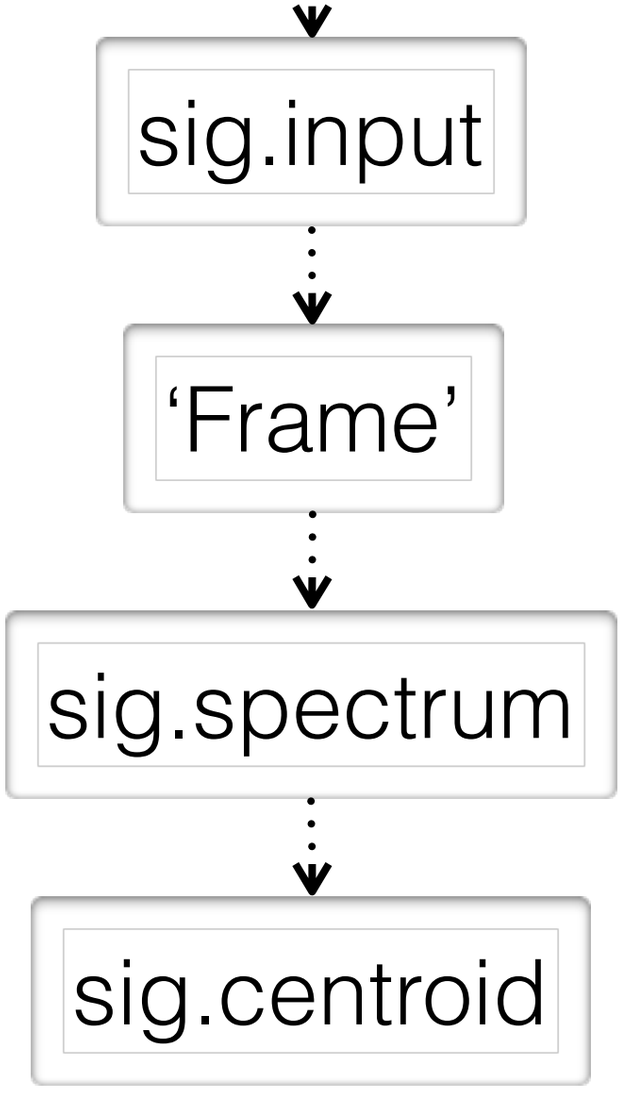
- a = miraudio('bigfile')
- f = mirframe(a)
- s = mirspectrum(f)
- mircentroid(s)
- mircentroid('bigfile', 'Frame')

Data flow graph design & evaluation



- a = miraudio('**Design**', …)
- s = mirspectrum(f, 'Frame', …)
- c = mircentroid(s)
- **mireval**(c, 'bigfile')

Data flow graph in MiningSuite



- a = sig.input('bigfile', …);
- s = sig.spectrum(f, 'Frame', …);
- c = sig.centroid(s)

; → No operation is performed.
(The data flow graph is constructed without actual computation.)

sig.design
data flow graph design

- ***a*** = *sig.input('bigfile', …);*
- ***s*** = *sig.spectrum(a);*
- ***c*** = *sig.centroid(s)*

sig.design objects, storing only the data flow graph

Design now evaluated in order to display the results.

- ***c***

But results was not stored in **c**, so displaying again **c** triggers another evaluation of the design.

- *d* = ***sig.ans***

The last evaluation is stored in ***sig.ans***.

- *d* = *c****.eval***
- *d* = *c****.getdata***

Evaluate and store in a variable.

sig.design.show
data flow graph display

- ***a*** *= sig.input(…);*
- ***s*** *= sig.spectrum(a);*
- ***c*** *= sig.centroid(s)*
- *c****.show***

sig.signal.design
design stored in the results

- *a = sig.input(…);*
- *s = sig.spectrum(a);*
- *c = sig.centroid(s);*
- *d = c.eval*
- *d**.design***

- *save result.mat d*

1 year later:

- *load result.mat*
- *d* ⟶ the results
- *d**.design***

the data flow graph design
is automatically stored

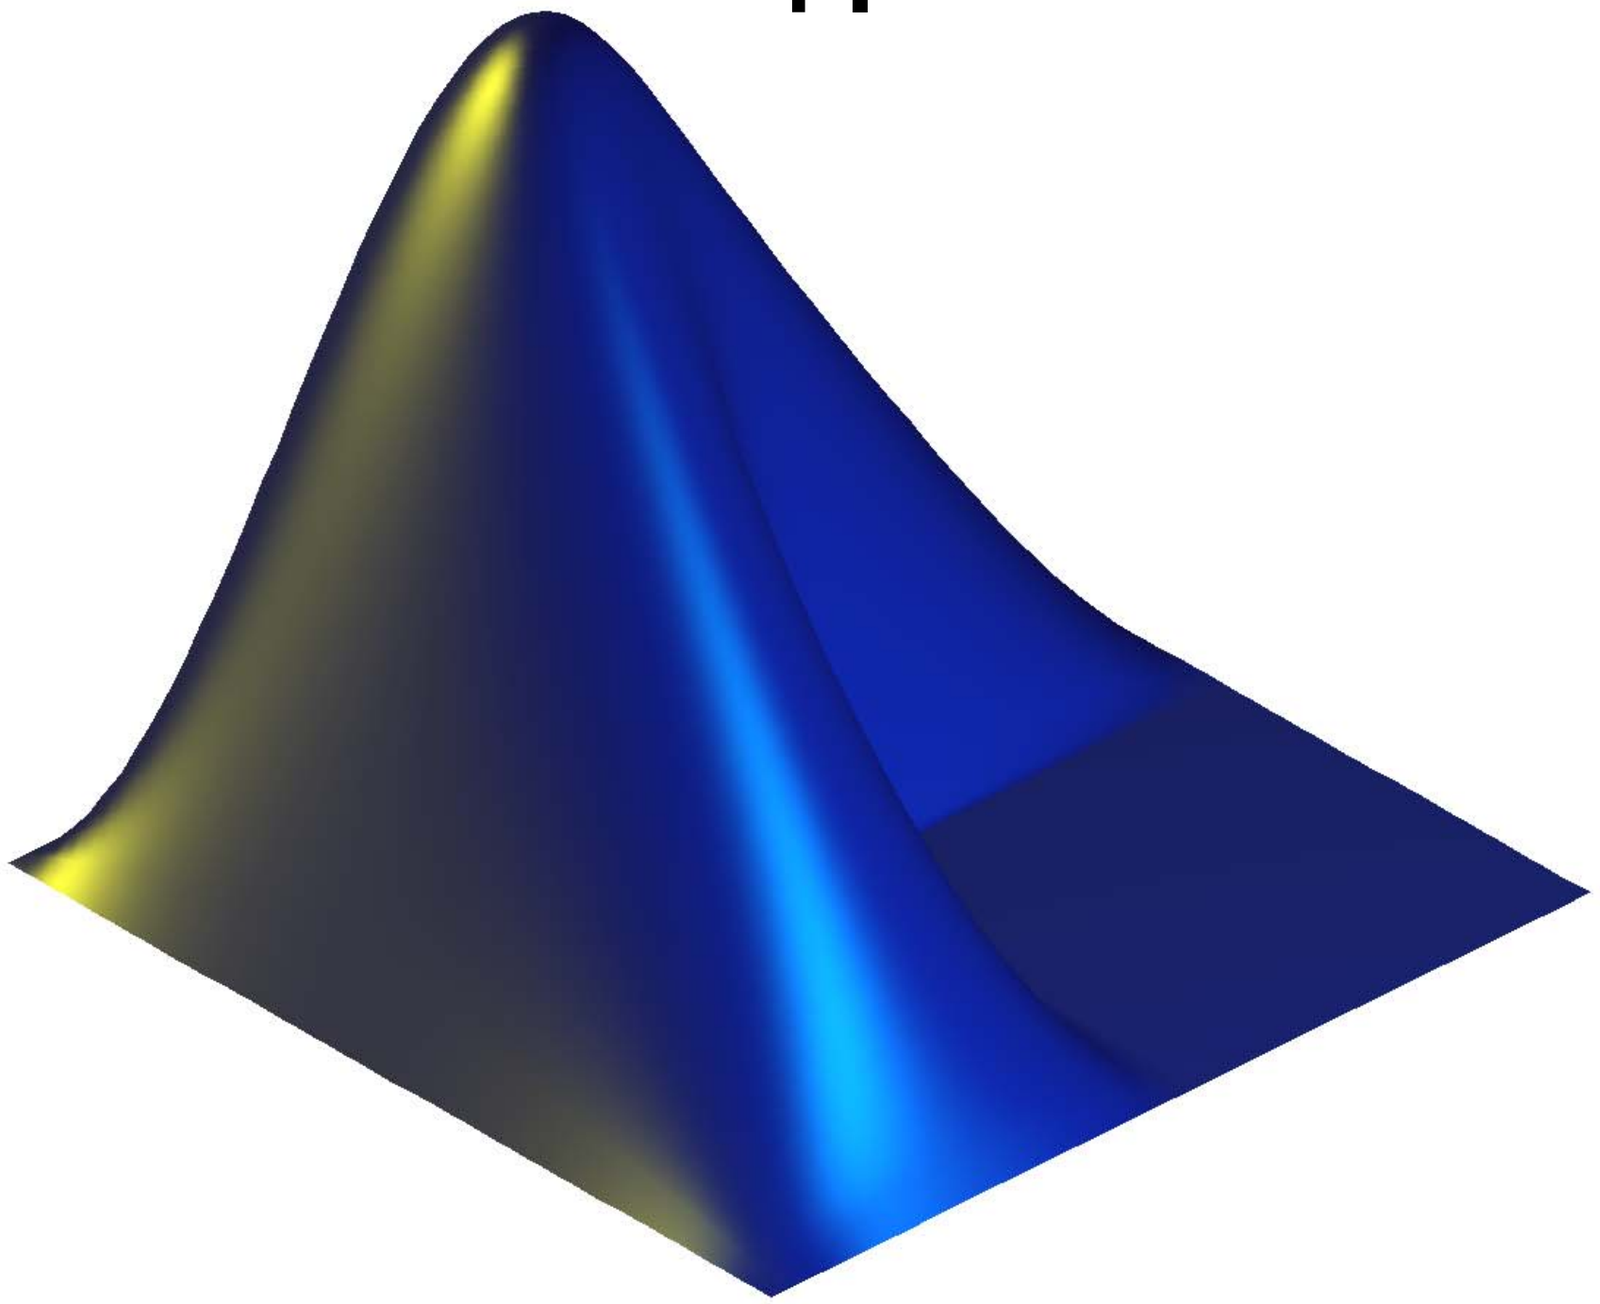
4.



How it works

Matrix convention in *MIRtoolbox*

- In standard *Matlab* code, processing of matrix dimensions makes the code somewhat obscure.

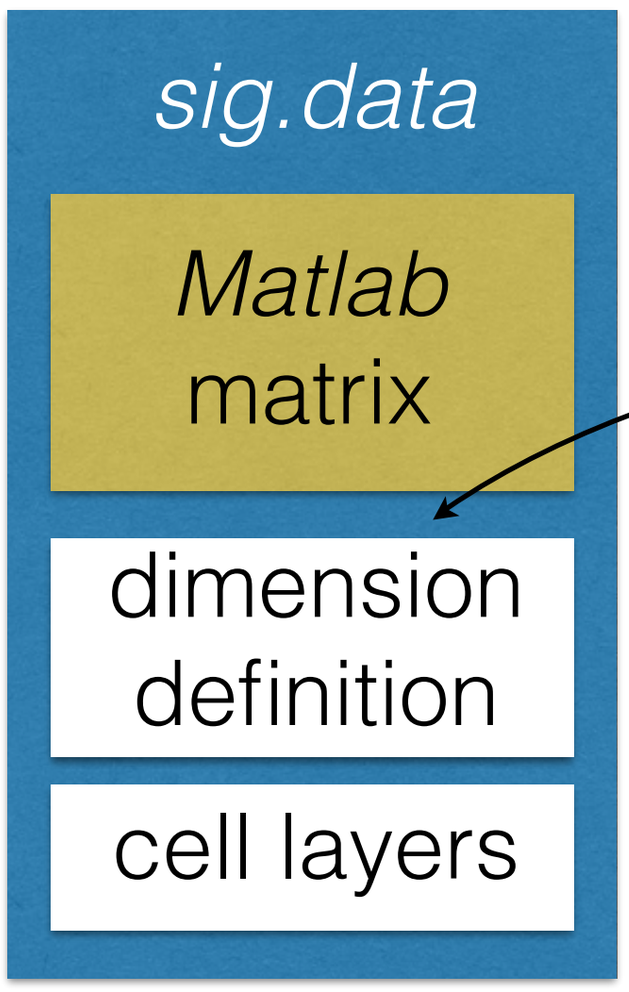
- In *MIRtoolbox*, one single matrix convention:

  - each frame forms a column, 3d dim for channels

- This convention should be followed everywhere in the code, and is not explicitly explained to the readers.

sig.data

- New syntactic layer on top of *Matlab* that makes operators' code simpler.



For instance:
{element,sample,channel}

- 1st dim: signal (for instance, spectrum)
- 2nd dim: successive frames
- 3rd dim: channels

sig.data

- *x.**size**(‘**sample**’)* gives the number of samples.

- *x.**sum**(‘**channel**’)* sums the matrix along the channel dimension.

- *x**.times**(y)* multiplies two *sig.data* objects, respecting dimension type congruency.

- *x**.apply**(@xcorr,{},{’**sample**’},2)* applies *xcorr* along the sample dimension. The last argument notifies that *xcorr* does not work for matrices with more than 2 dimensions. The extra dimensions are automatically covered via loops.

sig.design.display → *sig.design.eval* → *sig.signal.display*

sig.design object, storing only the data flow graph

- ***a*** *= sig.input('bigfile', …)*
- *d =* ***sig.ans***
- *d = a****.eval****;*
- *d*

sig.design.display = ***sig.design.eval***, which outputs a ***sig.signal*** and calls ***sig.signal.display***

the outputted ***sig.signal***

sig.design.eval outputs a ***sig.signal***

sig.signal.display

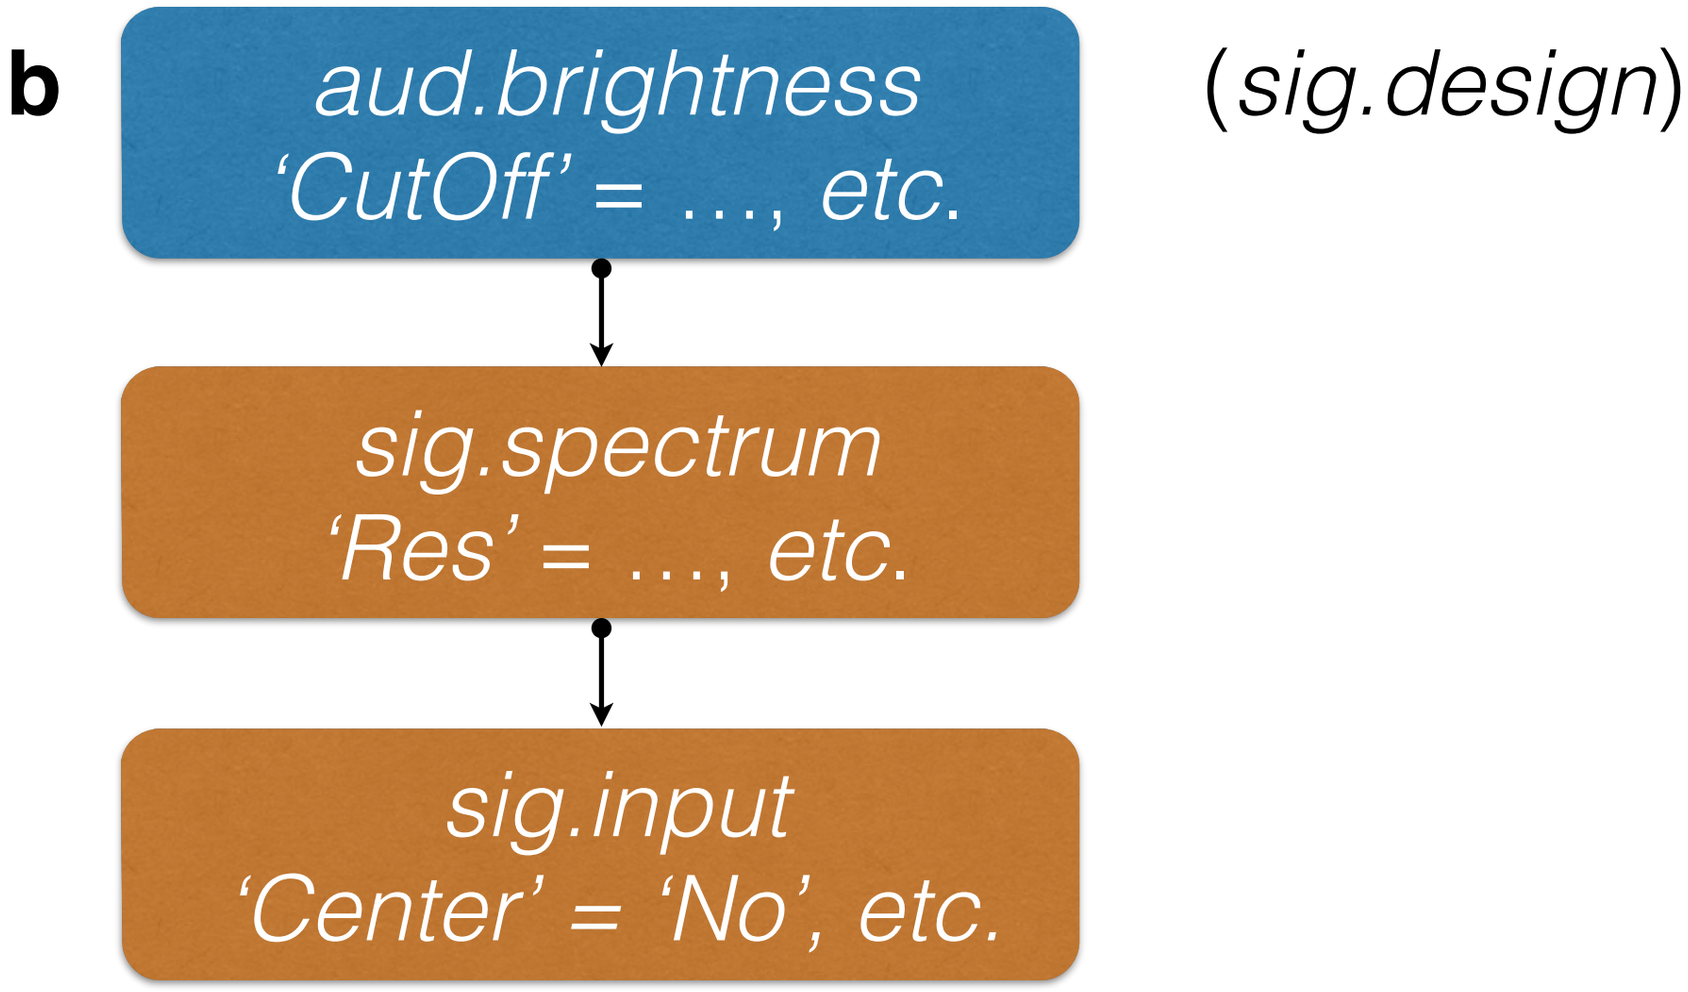
init

deploy the implicit data flow prior to the actual operator

- *b = aud.brightness('ragtime', 'Frame')*



(*sig.design*)

sig.operate
operators' main routine

+aud/brightness.m:

```
function varargout = brightness(varargin)
    varargout = sig.operate('aud', 'brightness', options, …
                                @init, @main, varargin, 'plus');
end
```

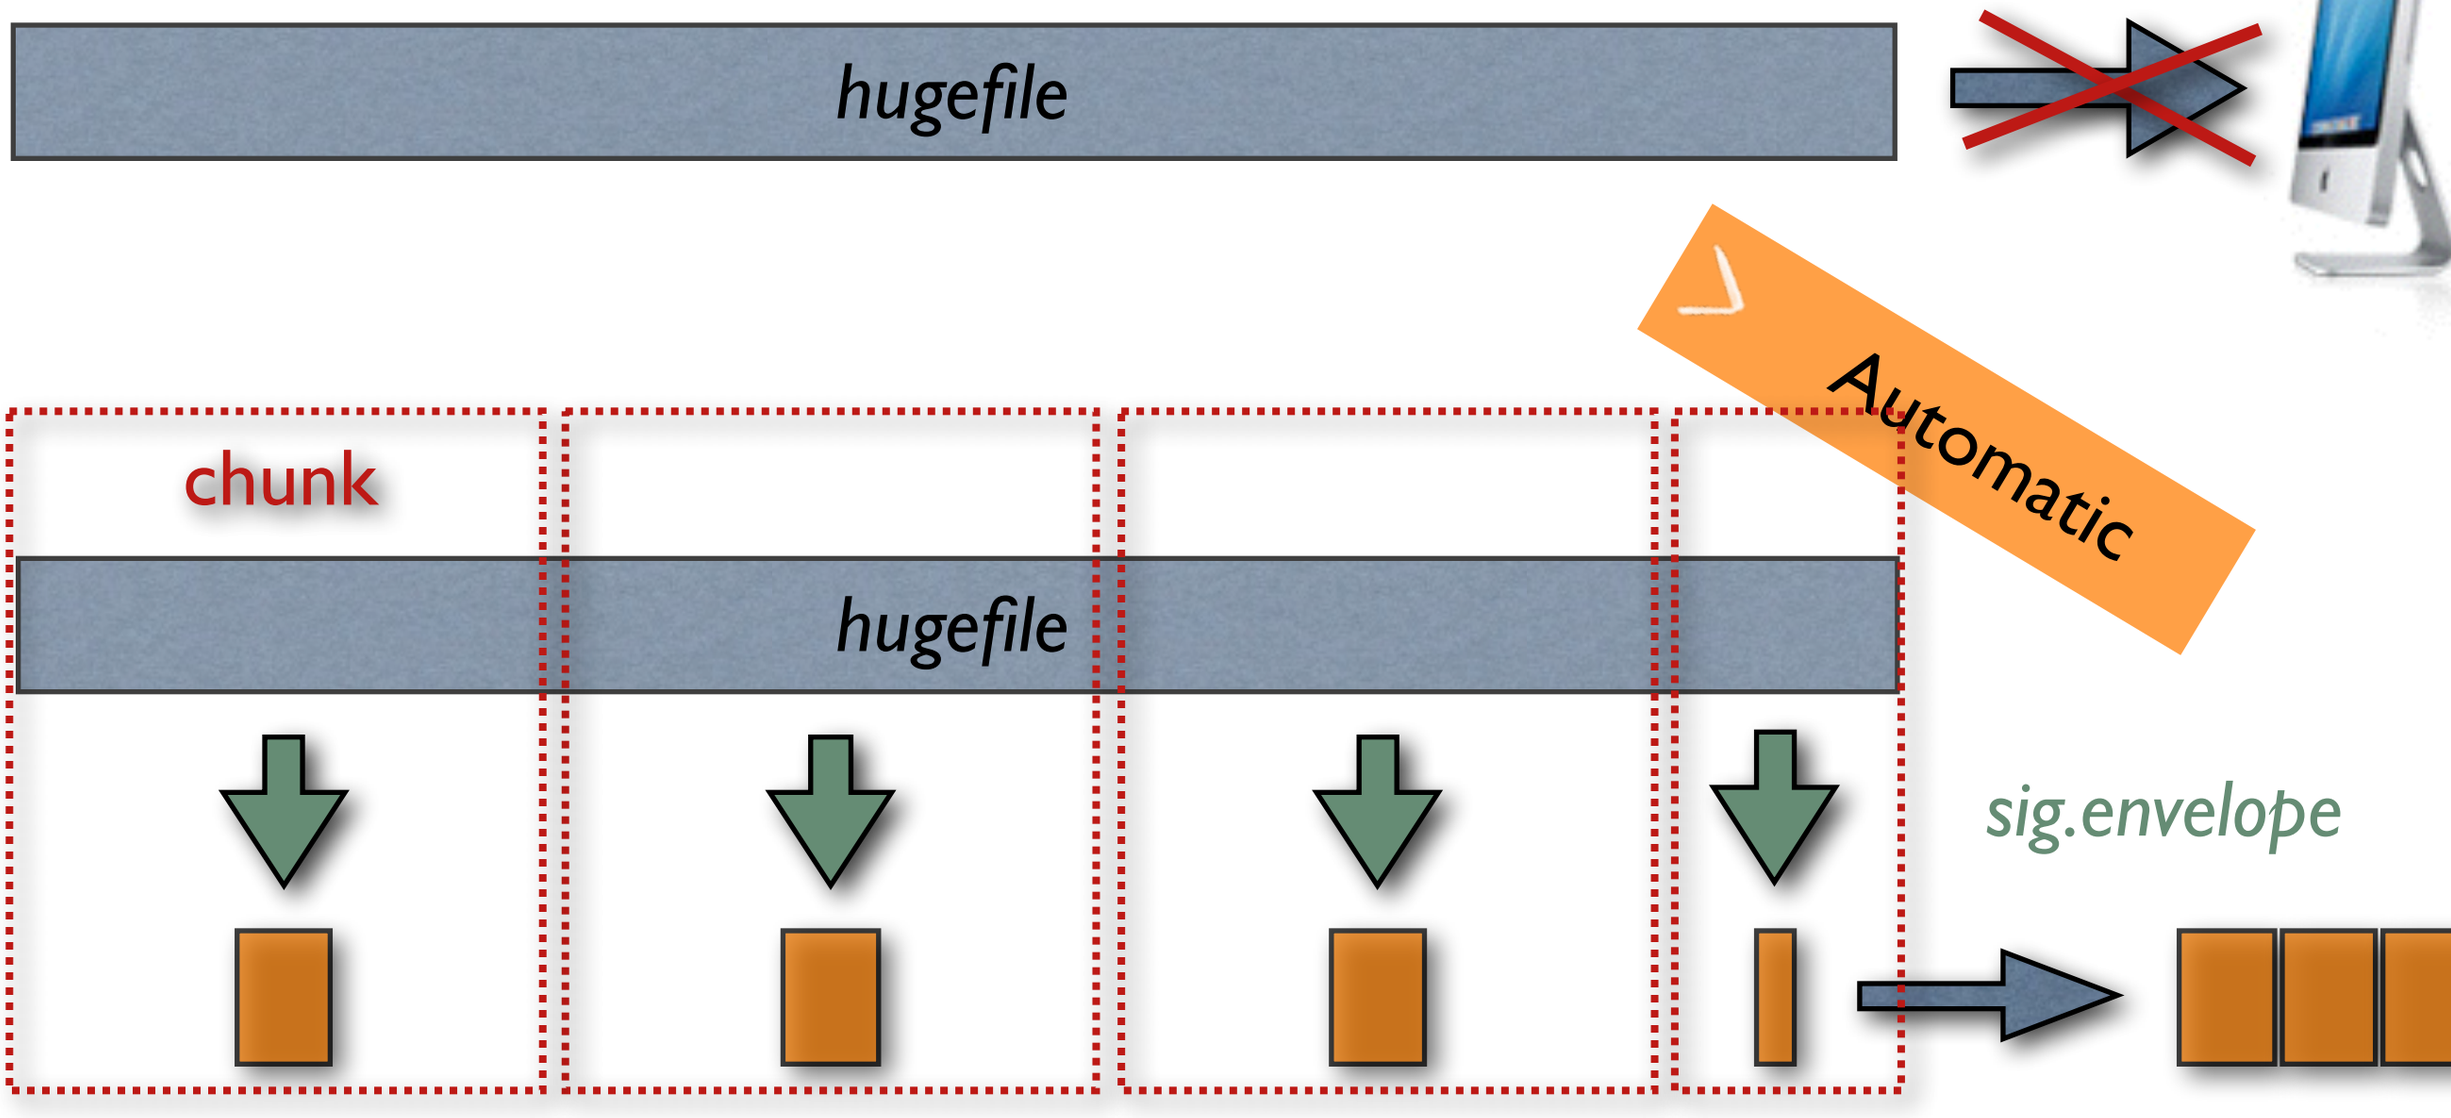
aud.brightness ('ragtime', 'Frame')

sig.operate

- first parses the **arguments** in the call,
- then creates a data flow design:
  - starts with implicit data flow (@init)
  - ends with @main routine.

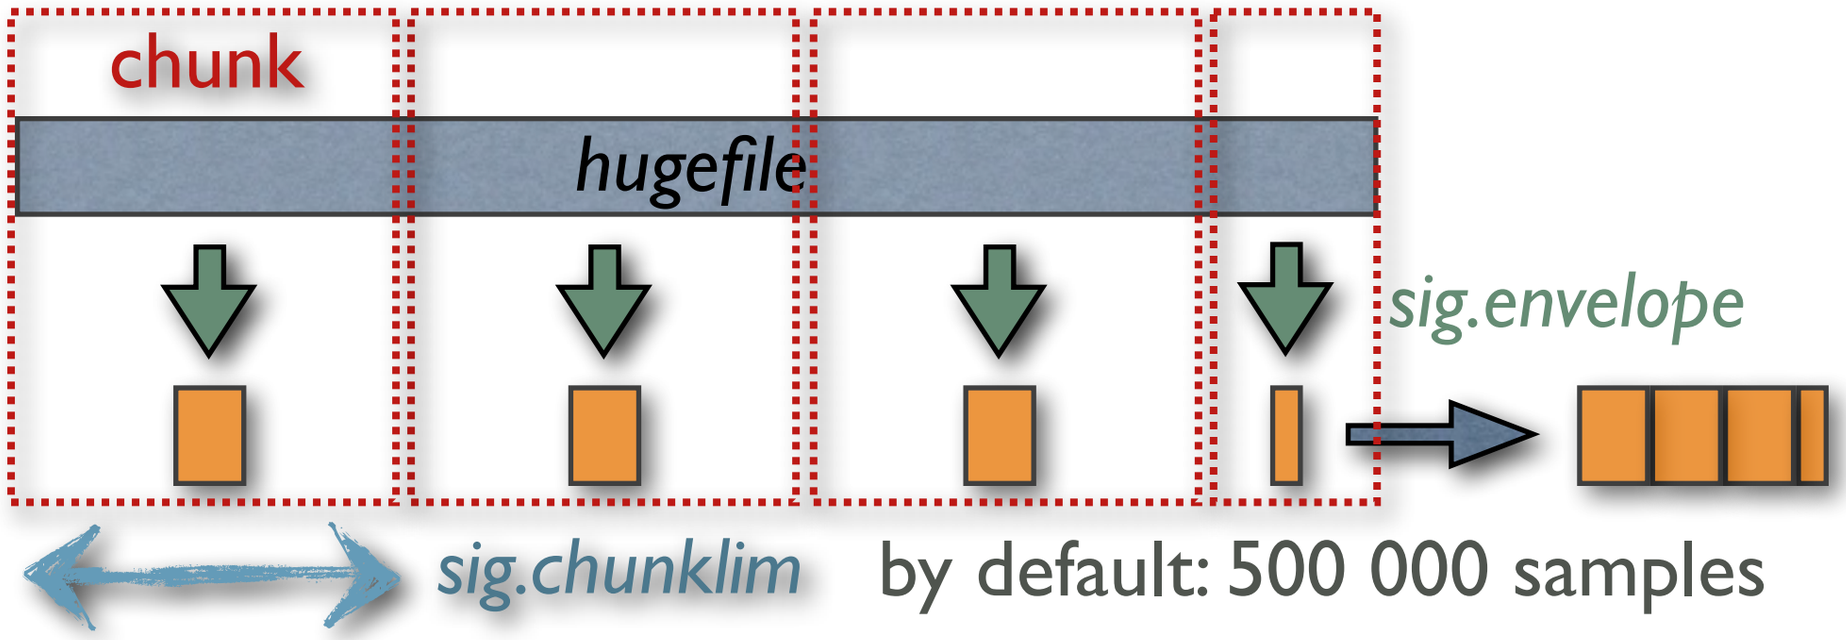
memory management

sig.envelope('hugefile');



sig.chunklim
chunk size limitation

sig.envelope('hugefile');



- If memory overflow problems, decrease *sig.chunklim*:

sig.chunklim(50000) set to 50 000 samples

sig.design.eval
non-framed-based evaluation

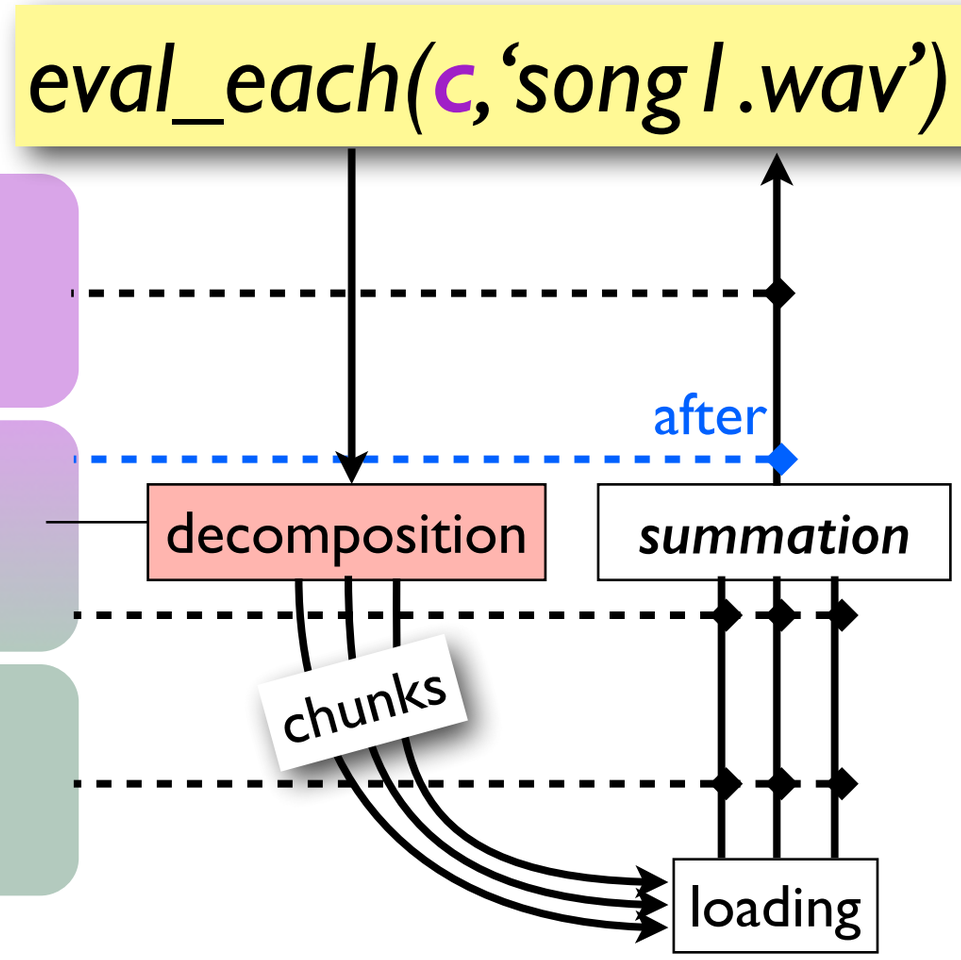
- *a* = *sig.input*;
- *c* = *aud.mfcc*(*a*);

eval_each(*c*,'*song1.wav*')

c *sig.design* type=*aud.mfcc*
options: *Rank*=1:13, *Delta*=0, ...

sig.design type=*aud.spectrum*
options: *Win*='*hamming*', ...

a *sig.design* type=*sig.input*
options: *Sampling*=11025, ...



sig.design.eval
framed-based evaluation

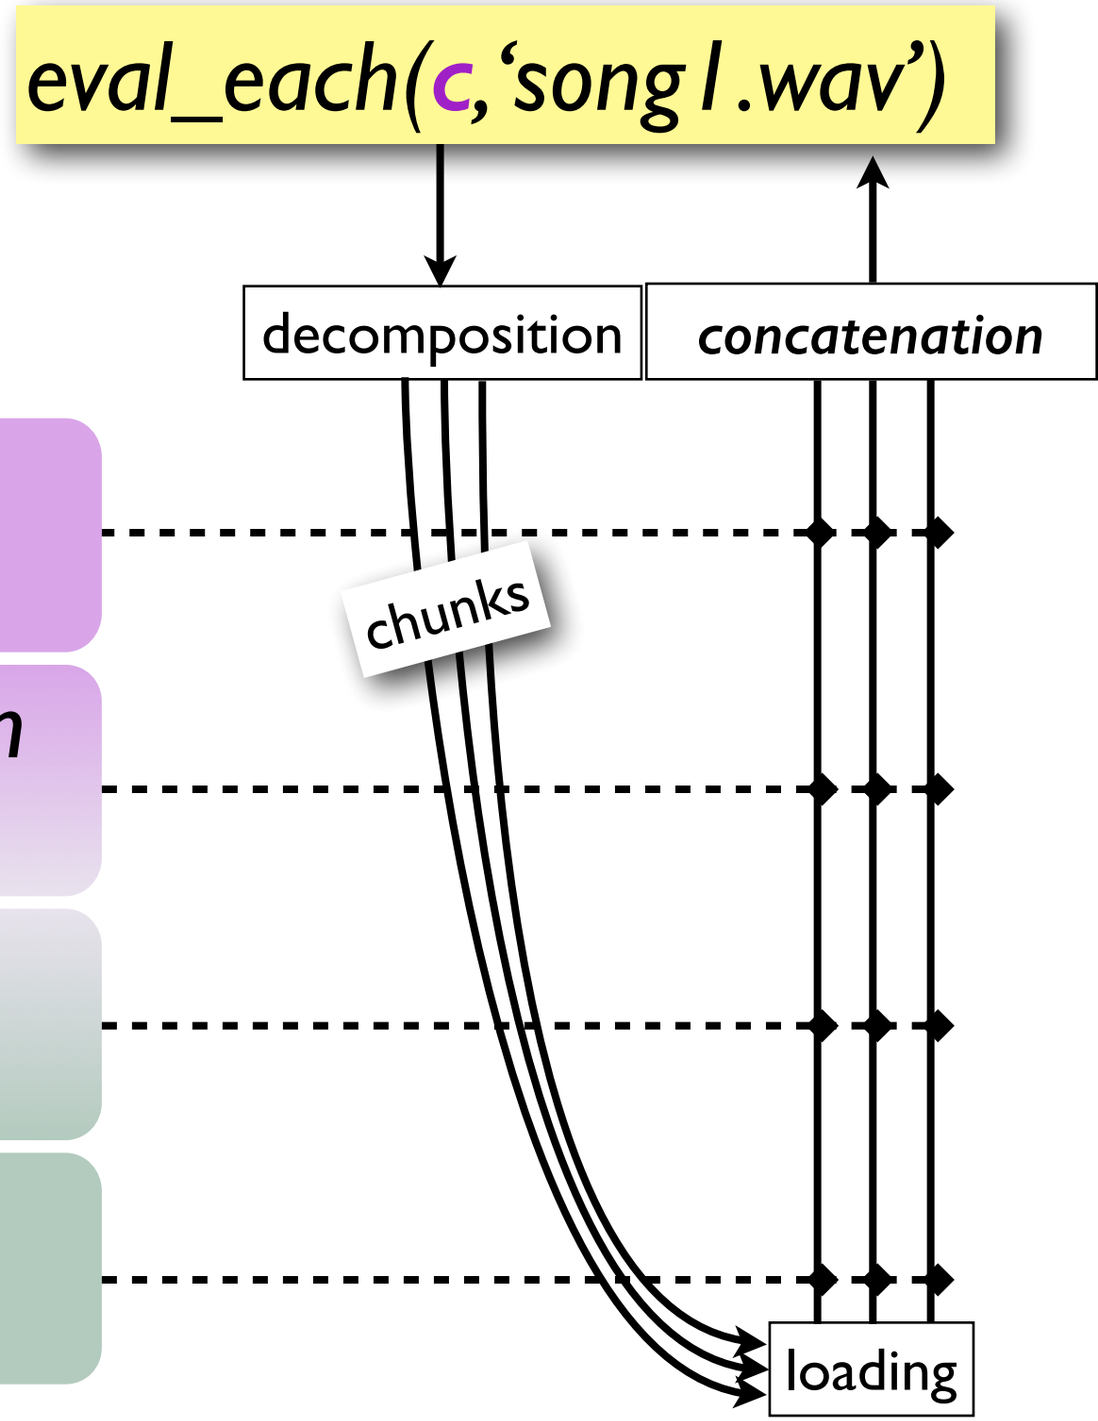
- *a* = *sig.input*;
- *c* = *aud.mfcc*(*a*);

c — *sig.design* type=*aud.mfcc*
options: *Rank*=1:13, *Delta*=0, ...

sig.design type=*aud.spectrum*
options: *Win*='*hamming*', ...

sig.design type=*sig.frame*
options: *Length*=.05, *Hop*=.5 ...

a — *sig.design* type=*sig.input*
options: *Sampling*=11025, ...



sig.design.eval
framed based evaluation

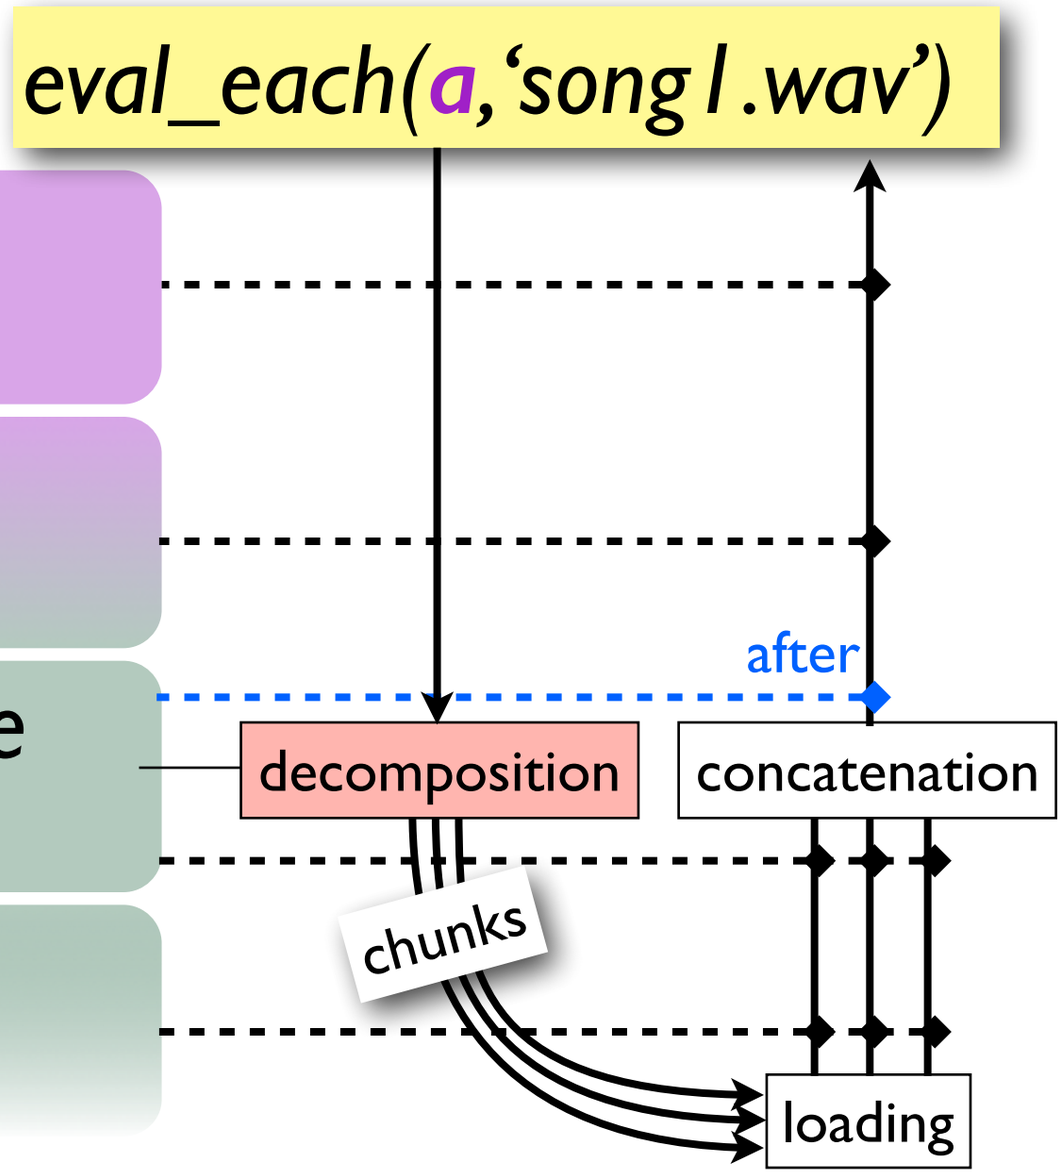
- *e* = *sig.envelope*
- *a* = *sig.autocor*(*e*, *'Frame'*);

a — *sig.design* type=*sig.autocor*
options: *Rank*=1:13, *Delta*=0, ...

sig.design type=*sig.frame*
options: *Win*='*hamming*', ...

e — *sig.design* type=*sig.envelope*
options: *Length*=.05, *Hop*=.5 ...

sig.design type=*sig.input*
options: *Sampling*=11025, ...



seq.sequence
symbolic sequence

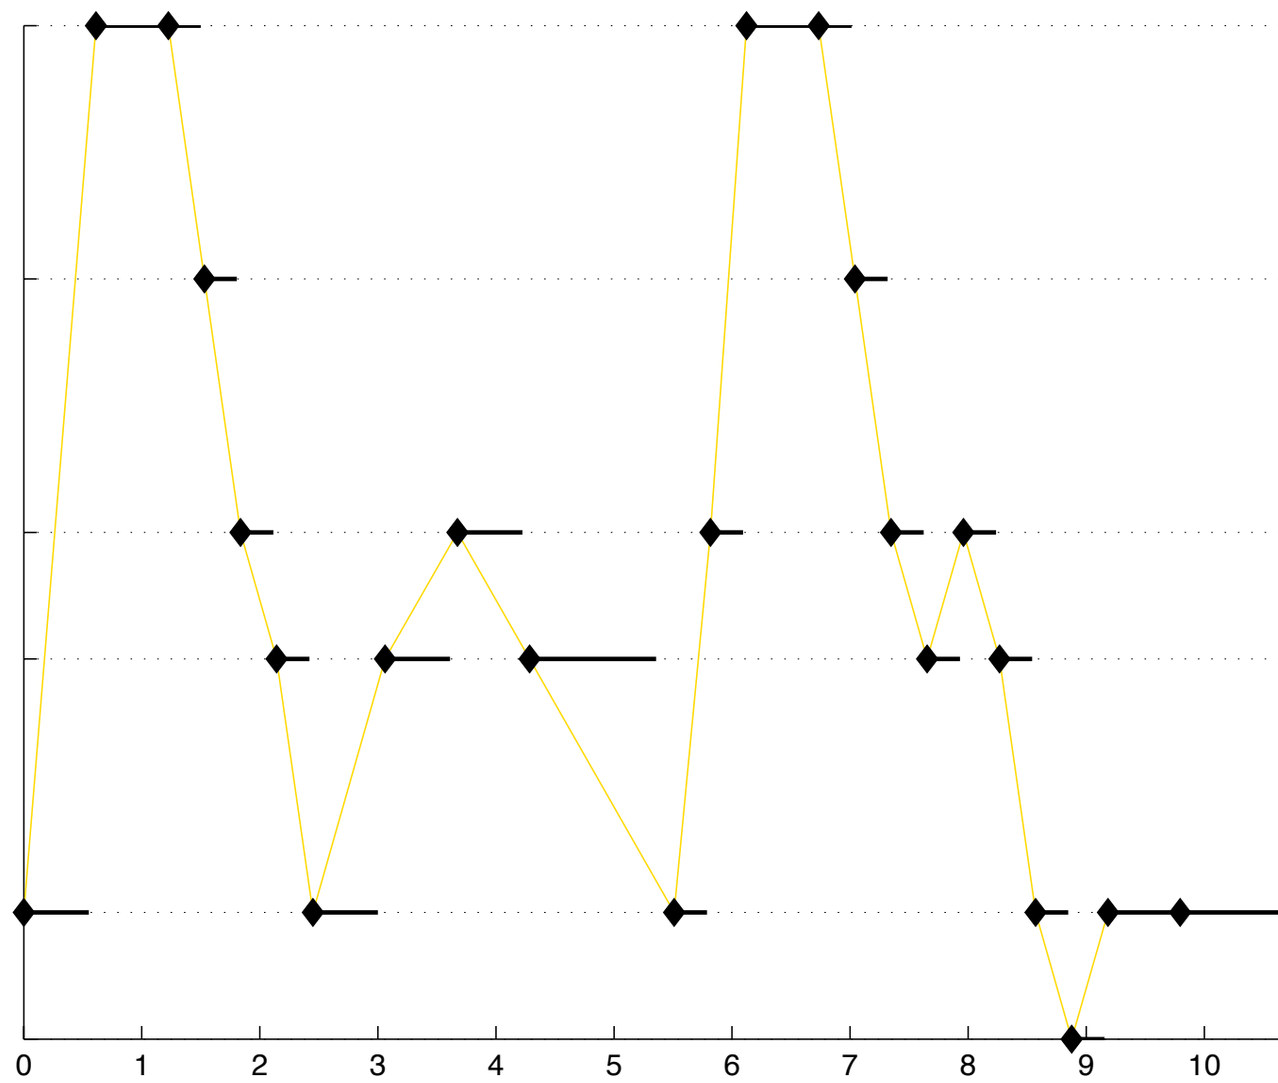
- Routines for symbolic sequence management. Elements of *seq.sequence* of class *seq.event*.

- …

seq.event
note characterization

Each note is a *seq.event*:

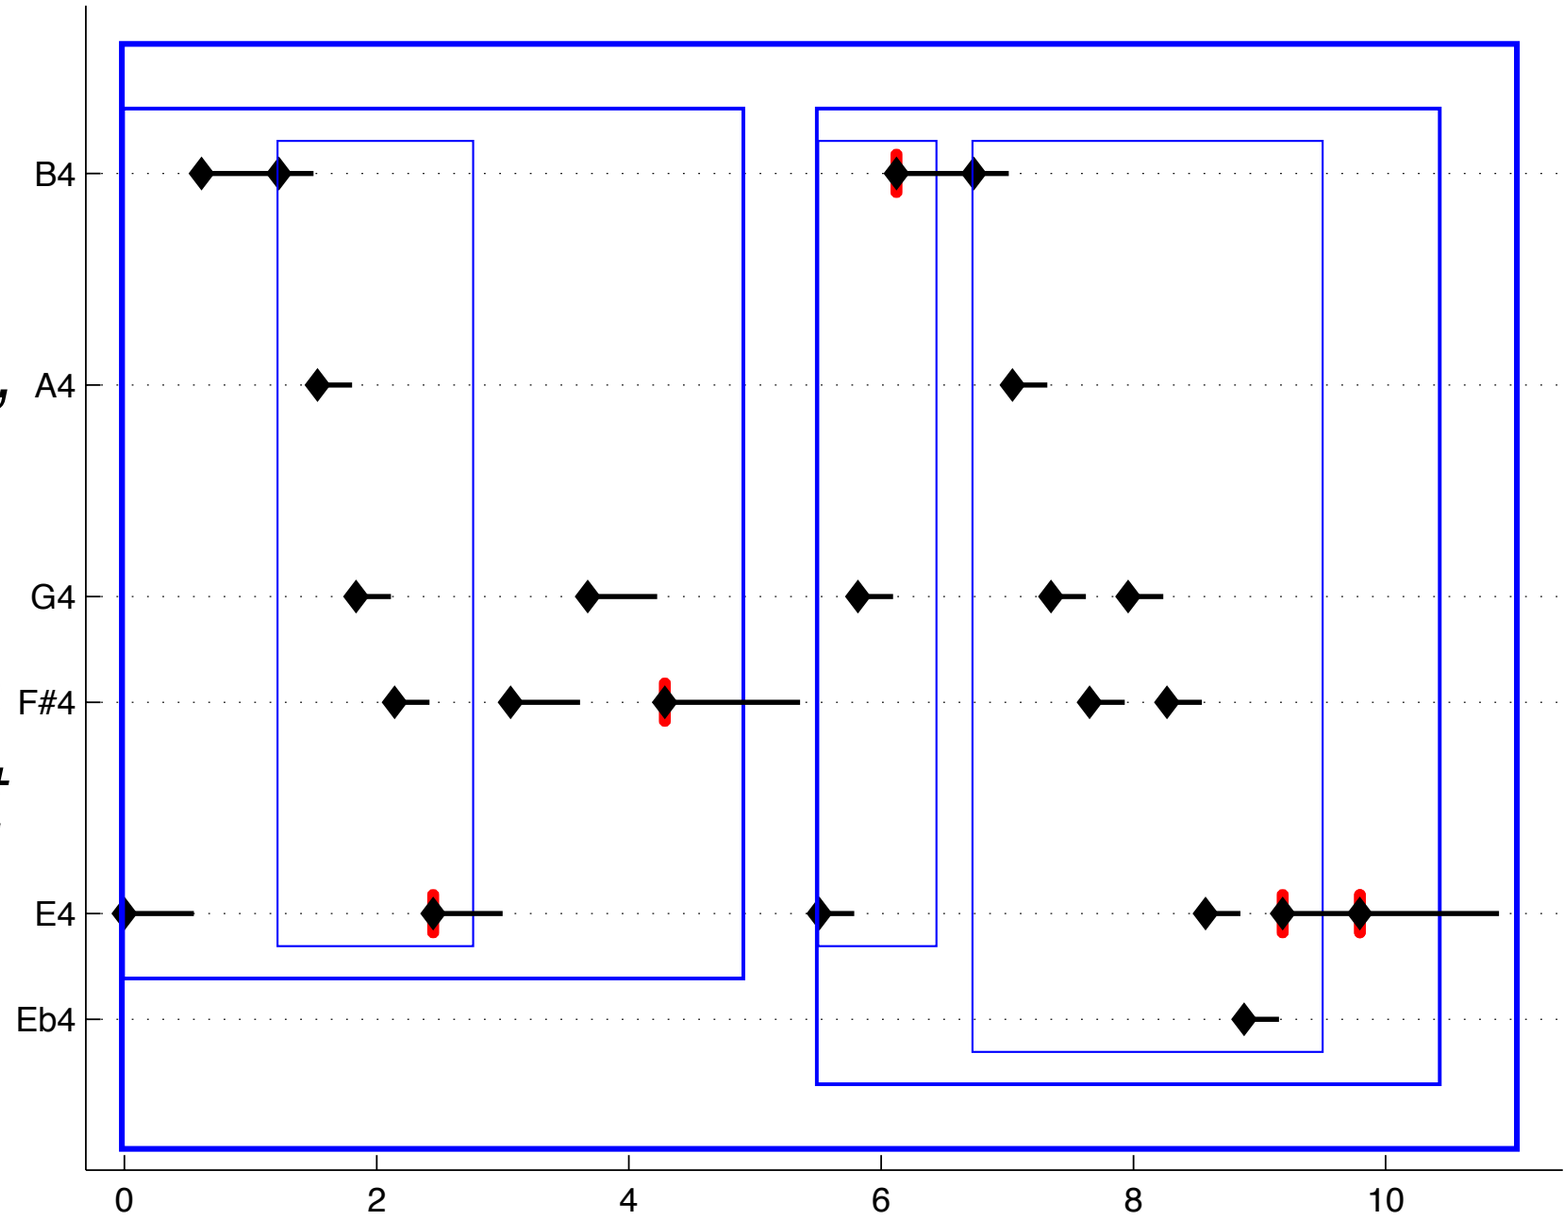
- characterization of the note: musical parameter (instance of class *seq.paramstruct*)
- previous note
- next note



mus.score(…, 'Group') hierarchical grouping

mus.score('laksin.mid', 'Group')

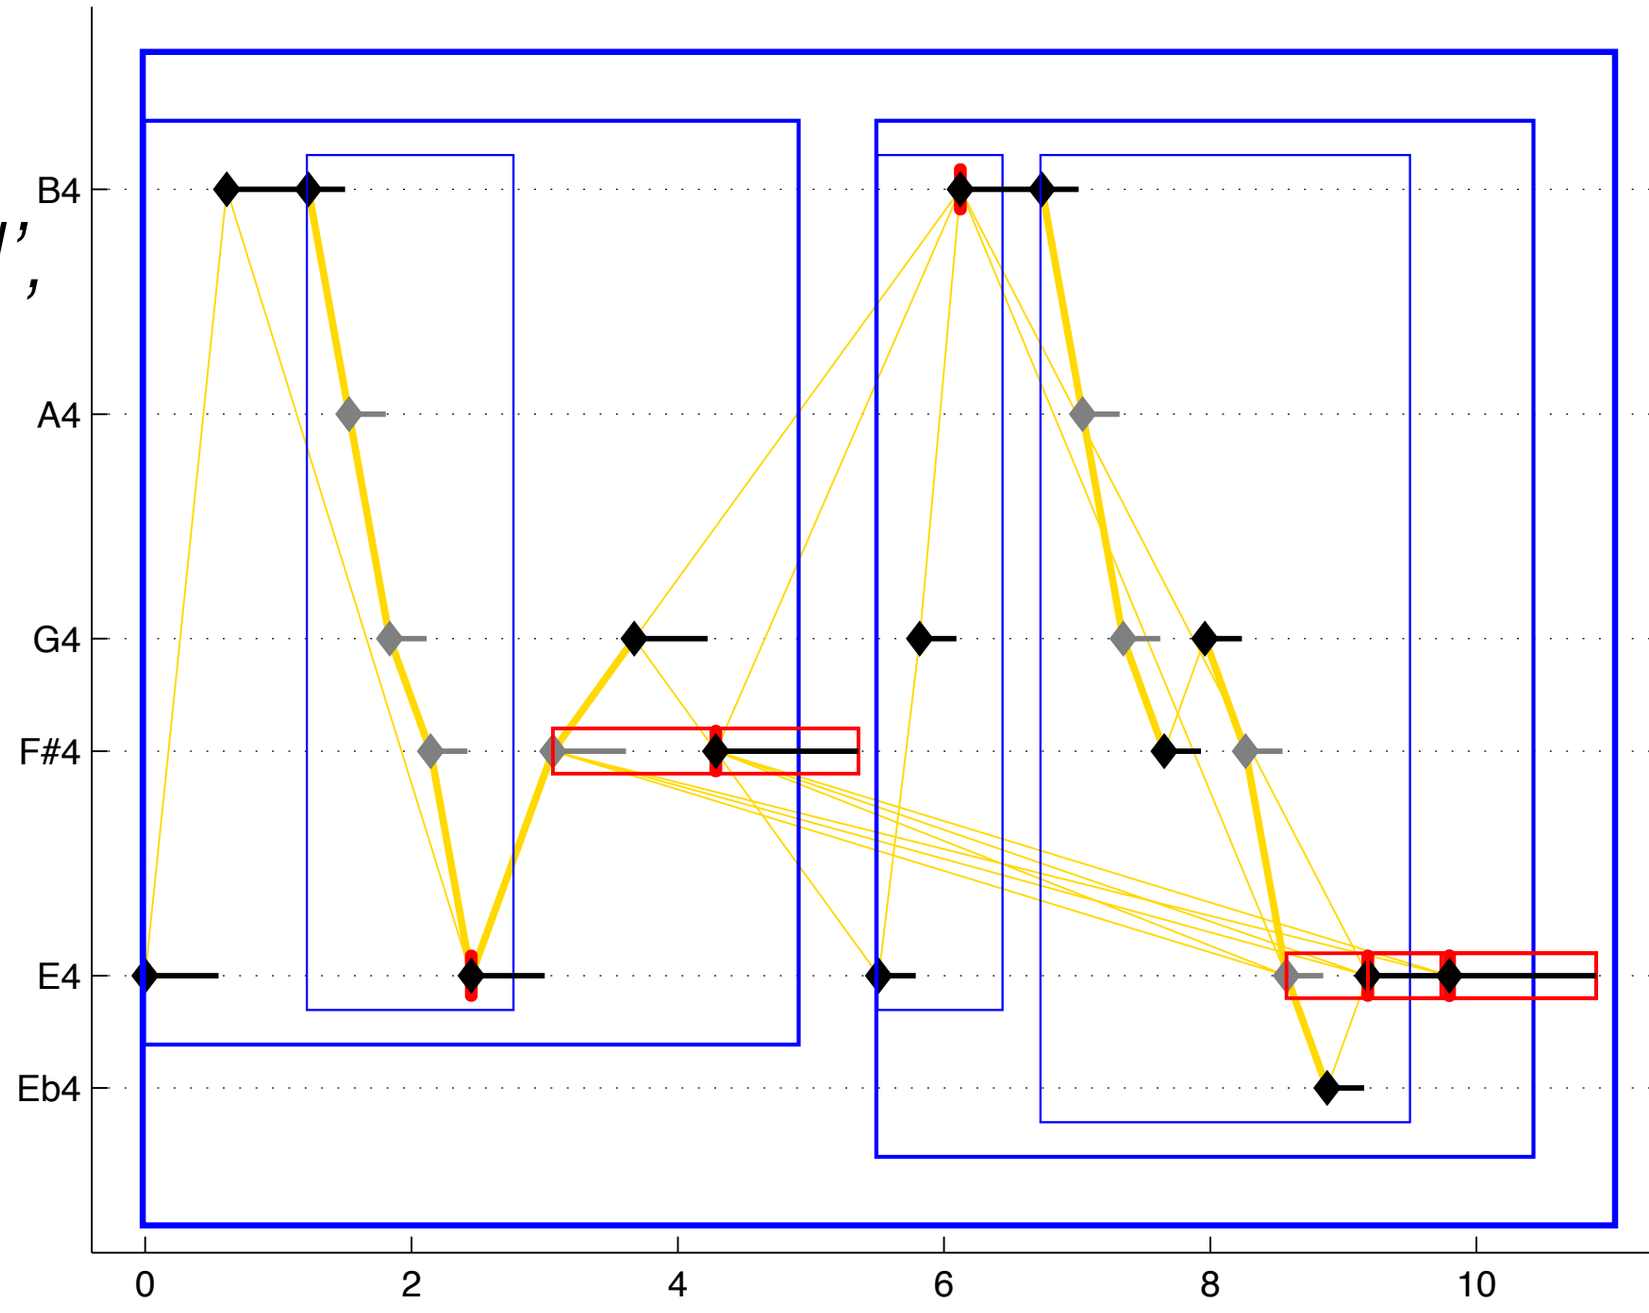
Groups, like notes, are instances of *seq.event*



mus.score(…, 'Reduce') ornamentation reduction

mus.score('laksin.mid', 'Group', 'Reduce')

Each syntagmatic relation between 2 notes is instance of *seq.syntagm*



mus.paramstruct
musical dimensions

each note:

- chromatic pitch

more general

- chromatic pitch class

- diatonic pitch (letter, accident, octave)

- diatonic pitch class

- onset, offset times (in s.)
- metrical position
- channel
- harmony, etc.

interval between notes:

- chromatic pitch interval

- chromatic pitch interval class

- diatonic pitch interval (number, quality)

- diatonic pitch interval class

- gross contour

- inter onset interval
- rhythmic value

seq.param
parameter management

- *common(p1,p2)* returns the common parametric description

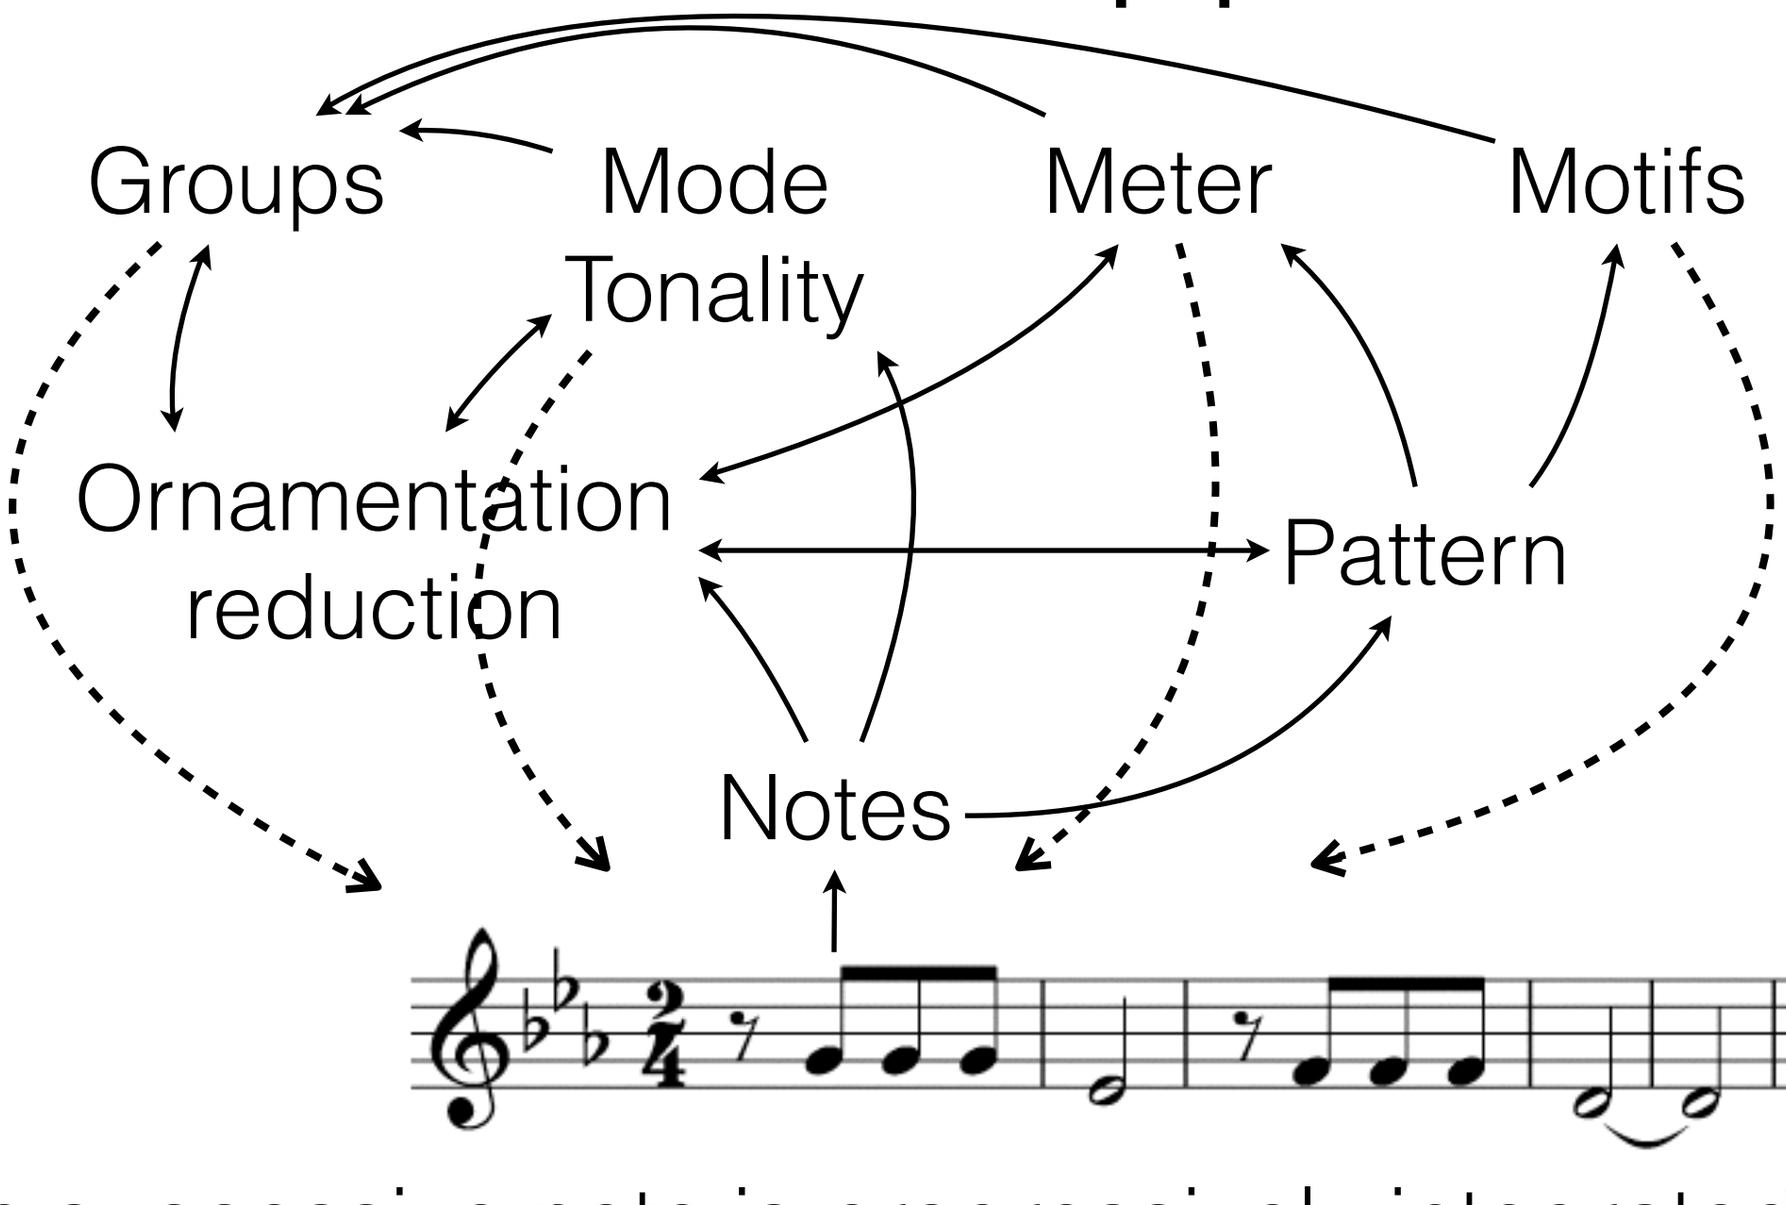
- *p1.implies(p2)* tests whether *p2* is more general than *p1*

seq.syntagm

s = seq.syntagm(n1,n2)

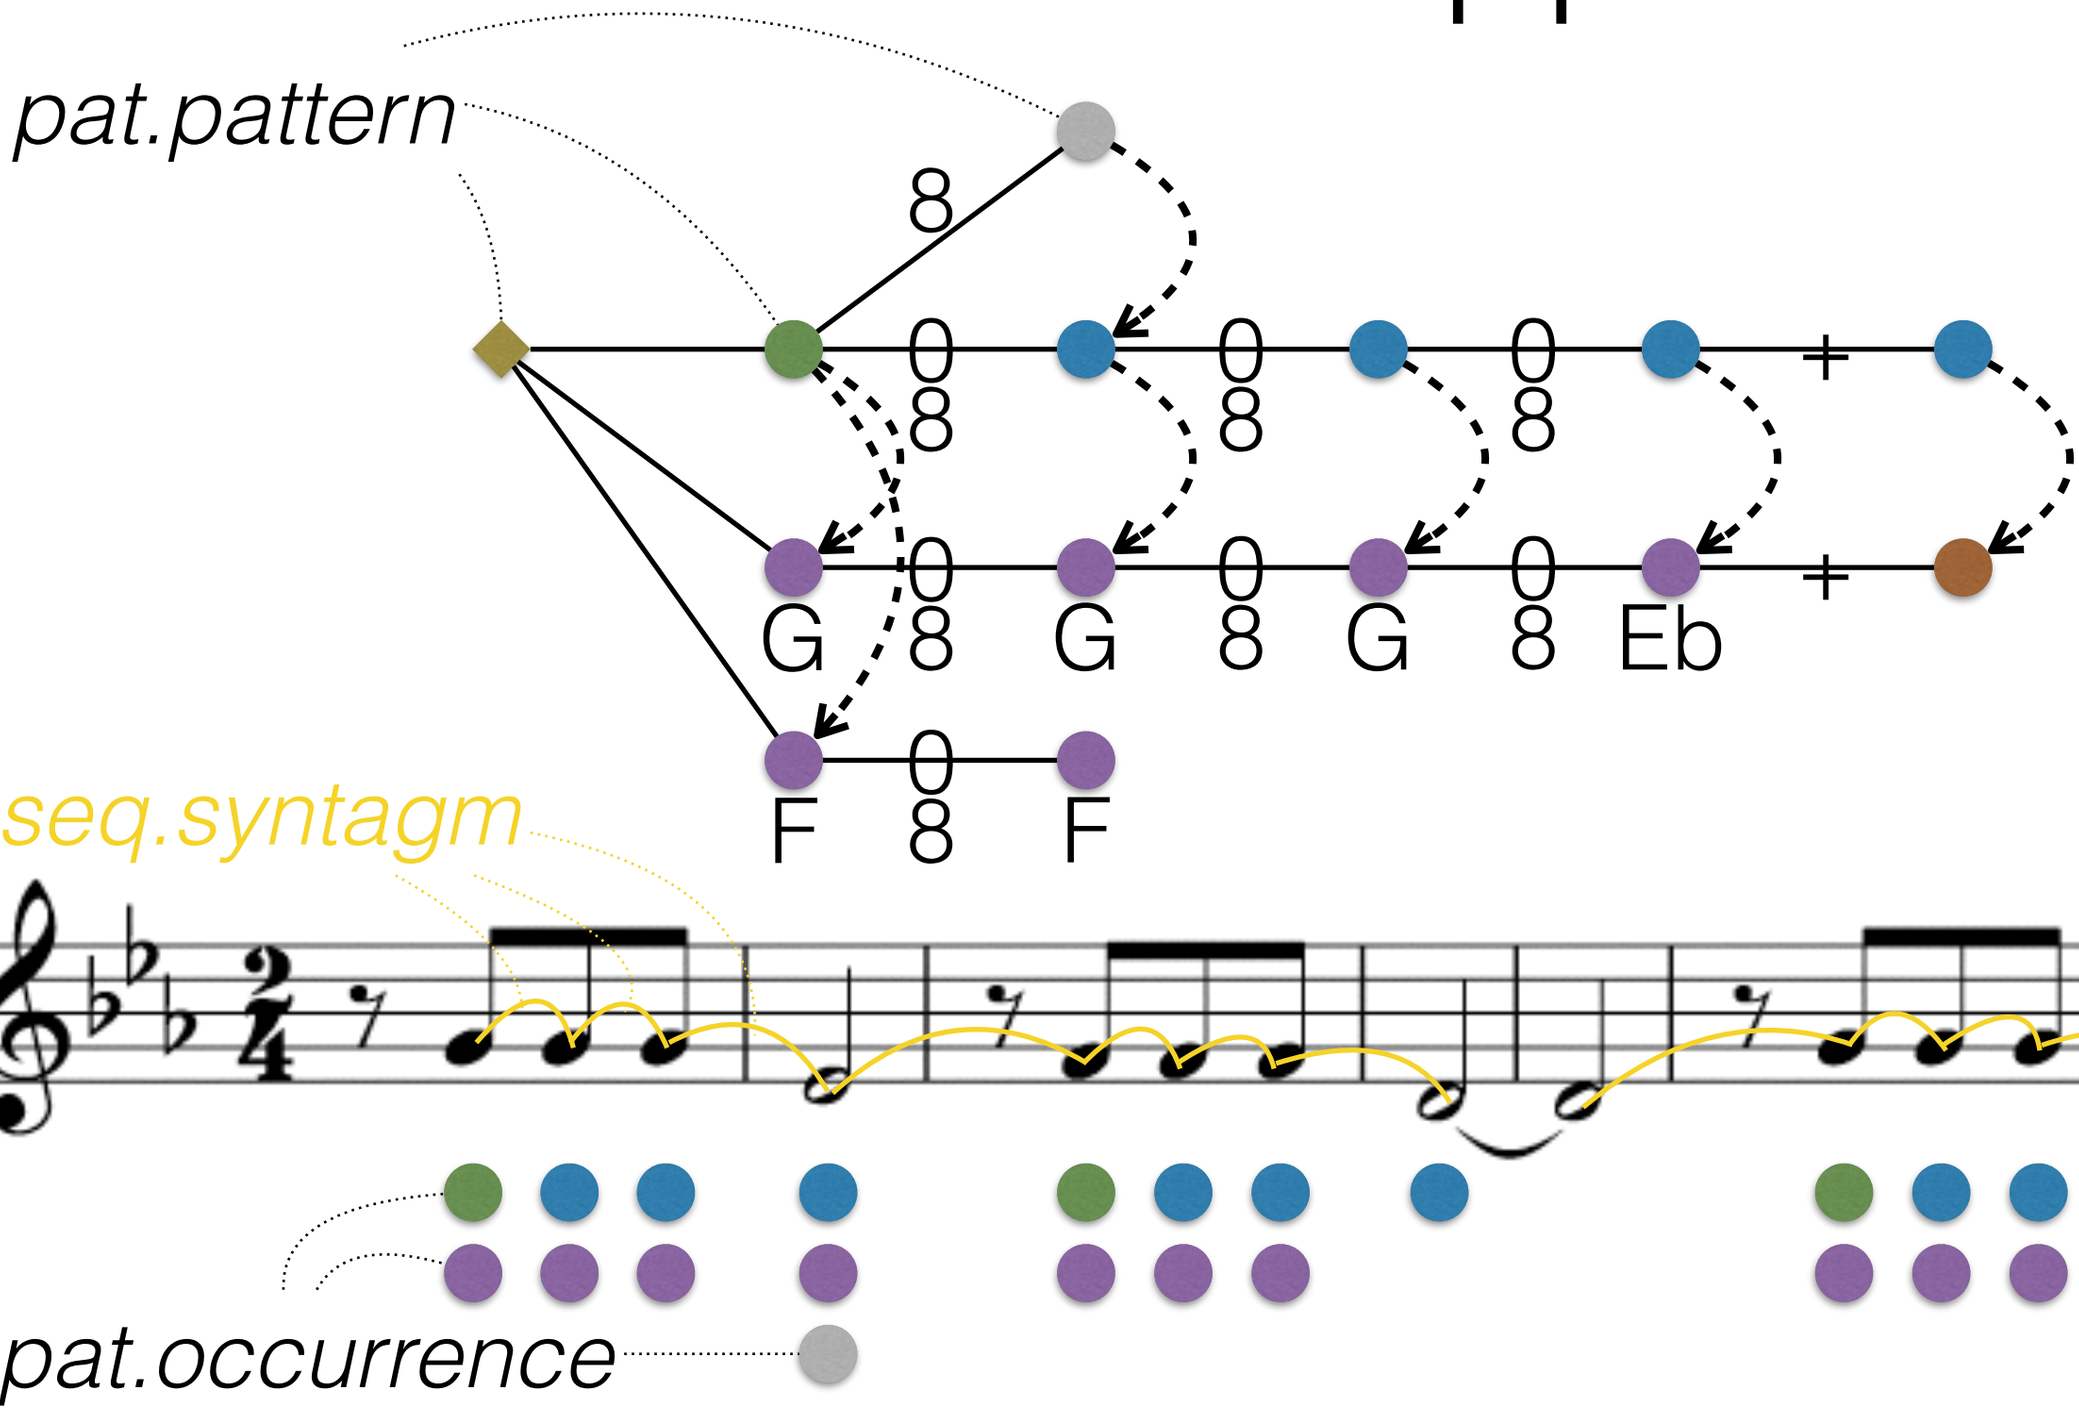
- *s.param* is automatically computed from *n1.param* and *n2.param*

mus.score
incremental approach

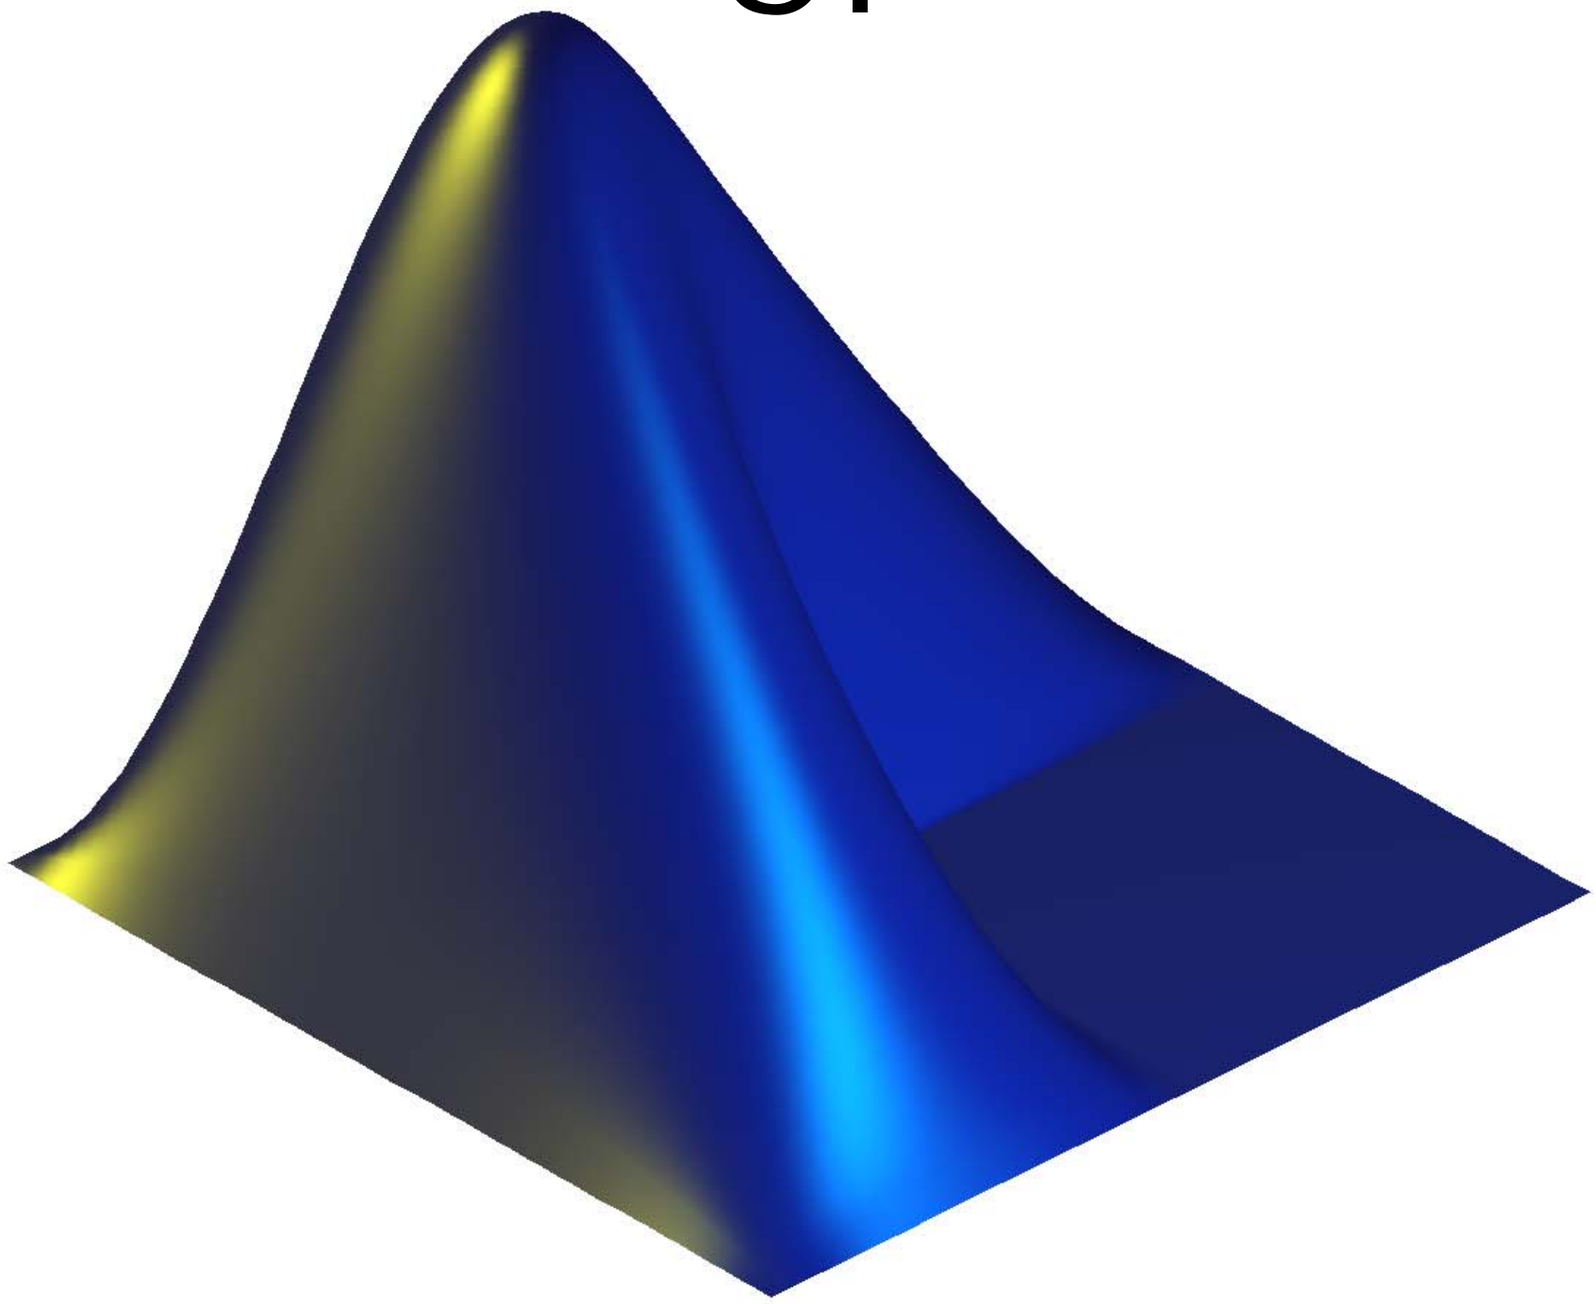


Each successive note is progressively integrated to all musical analyses, driving interdependencies.

mus.score
incremental approach



5.



How you can contribute

code structure of an operator

my_operator.m

```
function varargout = sig.my_operator(varargin)

    varargout = sig.operate('sig','my_operator',...

                    options,@init,@main,varargin,'plus');

end
```

options specification

my_operator(filename, ‘Threshold’, 100, ‘Normalize’)

```
thres.key = ‘Threshold’;

thres.type = ‘Numeric’;

three.default = 50;

options.thres = thres;
```

```
norm.key = ‘Normalize’;

norm.type = ‘Boolean’;

norm.default = 0;

options.norm = norm;
```

options specification

my_operator(filename, 'Domain','Symbolic')

```
domain.key = 'Domain';

domain.type = 'String';

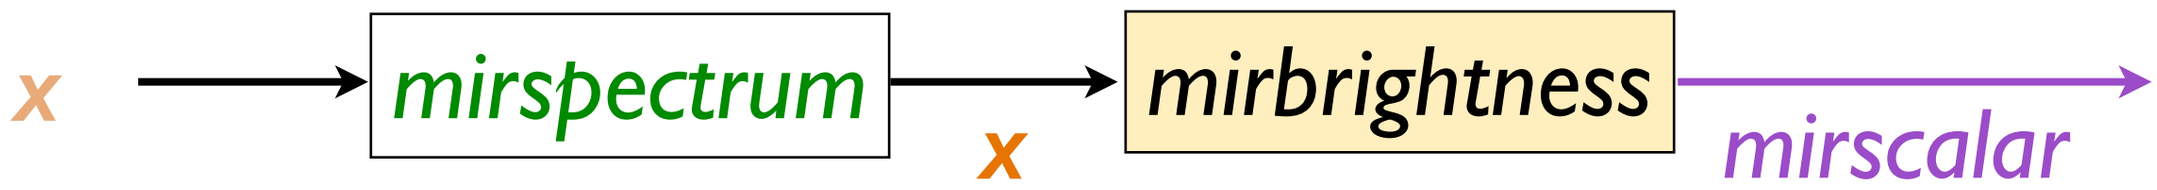
domain.choice = {'Signal', 'Symbolic'};

domain.default = 'Signal';

options.domain = domain;
```

init

implicit flowchart specification



```
varargout = mirfunction(@mirbrightness, x, varargin, nargout, specif, @init,
@main);

function [x type] = init(x, option)
if not(isamir(x, 'mirspectrum'))
    x = mirspectrum(x);
end
type = 'mirscalar';
```

istype

main

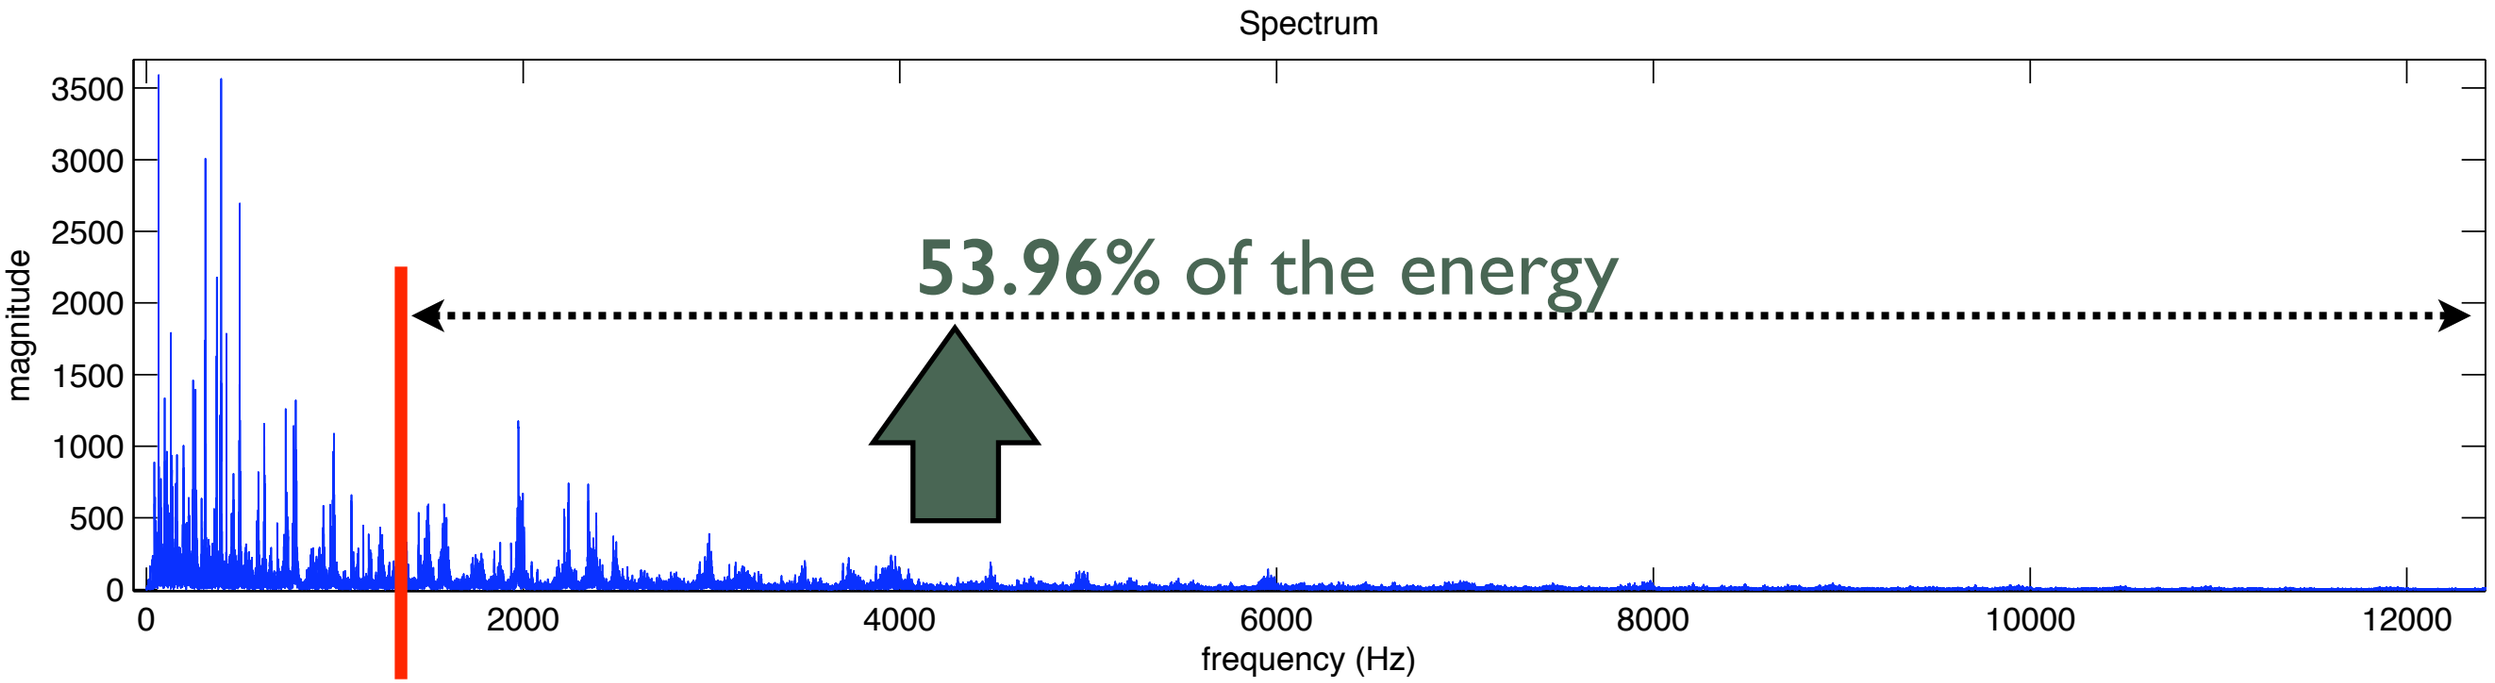
function main algorithm

varargout = mirfunction(@mirbrightness, x, varargin, nargout, specif, @init, @main);

```
function b = main(s, option)
m = get(s,'Magnitude');
f = get(s,'Frequency');
v = mircompute(@algo, m, f, option.cutoff, option.unit);
b = mirscalar(s, 'Data', v, 'Title', 'Brightness');

function v = algo(m, f, k, u)
v = sum(m(f(:,1)>k,:)) ./ sum(m);
if strcmp(u,'%')      v = v*100;      end
```

aud.brightness
example of function implementation



- *aud.brightness(…, '**CutOff**', 1500)* (in Hz)

- *aud.brightness(..., '**Unit**', u)* u = *'/1'* or *'%'*

```
function varargout = brightness(varargin)

   varargout =
sig.operate('aud','brightness',...

       initoptions,@init,@main,varargin,'plus');

end
```

```
function options = initoptions

   options = sig.signal.signaloptions(.05,.5);

      cutoff.key = 'CutOff';

      cutoff.type = 'Numeric';

      cutoff.default = 1500;

   options.cutoff = cutoff;

end
```

```
function [x type] = init(x,option,frame)

   x = sig.spectrum(x);

   type = 'sig.signal';

end
```

```
function out = main(in,option,postoption)

   x = in{1};

   if ~strcmpi(x.yname,'Brightness')

      res =
sig.compute(@routine,x.Ydata,x.xdata,option.cutoff);

      x = sig.signal(res{1},'Name','Brightness',...

                  'Srate',x.Srate,'Ssize',x.Ssize);

   end

   out = {x};

end
```

```
function out = routine(d,f,f0)

   e = d.apply(@algo,{f,f0},{'element'},3);

   out = {e};

end
```

```
function y = algo(m,f,f0)

   y = sum(m(f > f0,:,:)) ./ sum(m);

end
```

- All releases, *SubVersion* repository
- User's Manual and documentations in wiki environment
- Mailing lists: news, discussion, commitments, etc.
- Tickets to issue bug reports

Open-source project

- *MIRtoolbox* and initial version of *MiningSuite* is mainly the work of one person. Transition to a tool controlled by a community following standard open-source protocols.

- Whole code should be clearly readable, and be subject to correction/modification/enrichment by open community, after open discussions.

- Further development of the toolbox core (architecture, new perspectives) also subject to open discussion and community-based collaboration.

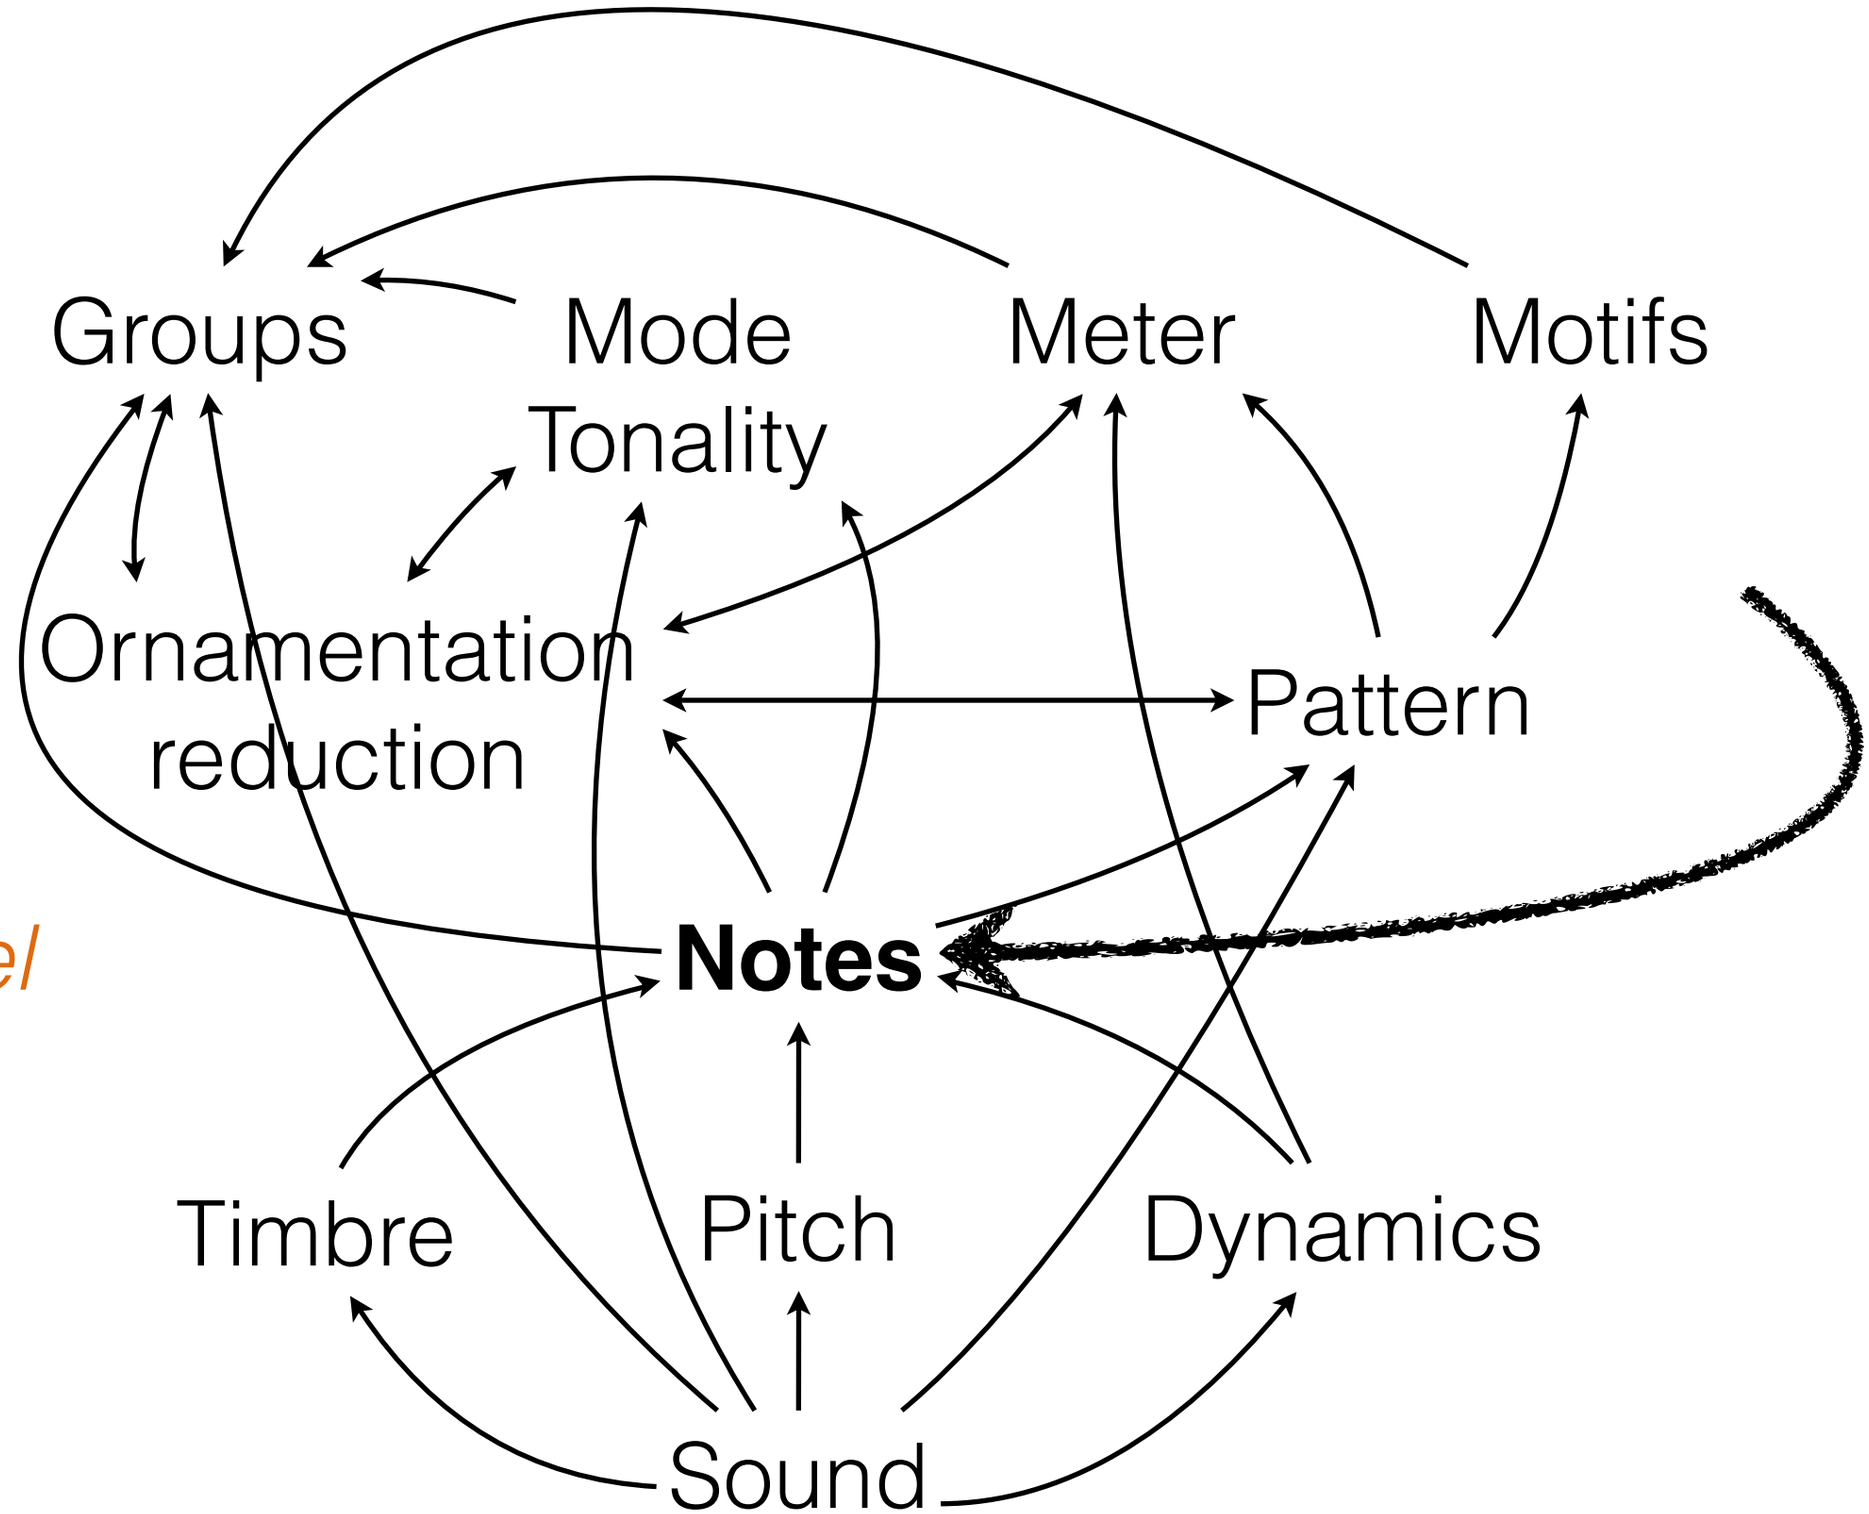
Open-source project Contribution acknowledgement

- Each contributor's participation is acknowledged, in particular in the copyright notice of source files to which he or she contributed.

- Each new model based on particular research is acknowledged in the documentation. In particular, users of the model are asked to cite the related research papers in their own papers.

- High-level musicological analysis could help refine the lower-level note transcription.

Structural levels



Symbolic level

Audio level

Future directions (on my side)

- Melodic transformations (ornamentation)
- Modelling form and style
- Metrical, tonal/modal analysis on symbolic domain
- Polyphonic analysis on symbolic domain

Future directions
(We need you!)

- Systematic test to check the validity of the results, to be run before each public version release
    - Measuring and controlling the variations of the results between versions
- Integrating other methods from the MIR literature
- Any other idea?
- We can also discuss about it during ISMIR.
